 BETHESDA, MD 20814

**BP - Conditions and Requirements for Testing
 Component Parts of Consumer Products
 Proposed Rule**

The contents of this document will be
 discussed at the Open Commission Meeting
 on Thursday, April 8, 2010 (1:00 p.m.)

THIS MATTER IS NOT SCHEDULED FOR A BALLOT VOTE.

A DECISION MEETING FOR THIS MATTER IS SCHEDULED ON: April 21, 2010

TO: The Commission
 Todd A. Stevenson, Secretary

APR - 1 2010

THROUGH: Cheryl A. Falvey, General Counsel *CF*
for Maruta Budetti, Executive Director *ie*

FROM: Philip Chao, Assistant General Counsel *PC*
 Harleigh Ewell, Attorney, OGC *HE*

SUBJECT: Proposed Rule: Conditions and Requirements for Testing Component Parts of Consumer Products

The Office of the General Counsel is providing, for the Commission's consideration, the attached draft *Federal Register* notice on a proposed rule that would establish requirements for how persons issuing certificates under section 14(a) of the Consumer Product Safety Act, as amended by section 102(b) of the Consumer Product Safety Improvement Act of 2008, that their products comply with applicable CPSC requirements may rely on tests obtained by suppliers of component parts, or others, as the basis for their certificates.

Please indicate your vote on the following options.

- I. Approve publication of the draft proposed rule in the *Federal Register* without change.

 (Signature)

 (Date)

RH 4/1/2010
 CLEARED FOR PUBLIC RELEASE
 UNDER CPSA 6(b)(1)

THIS DOCUMENT HAS NOT BEEN
 REVIEWED OR ACCEPTED BY THE
 COMMISSION.

II. Approve publication of the draft proposed rule in the *Federal Register* with changes.
(Please specify.)

(Signature)

(Date)

III. Do not approve publication of the draft proposed rule in the
Federal Register.

(Signature)

(Date)

IV. Take other action. (Please specify.)

CONSUMER PRODUCT SAFETY COMMISSION

16 CFR Part 1109

[CPSC Docket No. CPSC-2010-____]

Conditions and Requirements for Testing Component Parts of Consumer Products

AGENCY: Consumer Product Safety Commission.

ACTION: Notice of proposed rulemaking.

SUMMARY: The Consumer Product Safety Commission (“CPSC,” “Commission,” or “we”) is issuing a notice of proposed rulemaking regarding the conditions and requirements for testing of component parts of consumer products to demonstrate, in whole or in part, compliance of a consumer product with all applicable rules, bans, standards, and regulations: (1) to support a general conformity certificate or a certificate for a children’s product pursuant to section 14(a) of the Consumer Product Safety Act (CPSA); (2) as part of a reasonable testing program pursuant to section 14(a) of the CPSA; (3) as part of the standards and protocols for continued testing of children’s products pursuant to section 14(d)(2) of the CPSA; and/or (iv) to meet the requirements of any other rule, ban, standard, guidance, policy, or protocol regarding consumer product testing that does not already directly address component part testing.

DATES: Written comments must be received by [INSERT DATE WHICH IS 75 DAYS AFTER PUBLICATION IN THE FEDERAL REGISTER].

ADDRESSES: You may submit comments, identified by Docket No. [insert CPSC docket number], by any of the following methods:

Electronic Submissions: Submit electronic comments in the following way:

Federal eRulemaking Portal <http://www.regulations.gov> Follow the instructions for submitting comments. To ensure timely processing of comments, the Commission is no longer accepting comments submitted by electronic mail (e-mail) except through <http://www.regulations.gov>.

Written Submissions: Submit written submissions in the following way:

Mail/Hand delivery/Courier (for paper, disk, or CD-ROM submissions), preferably in five copies, to: Office of the Secretary, Consumer Product Safety Commission, Room 820, 4330 East West Highway, Bethesda, MD 20814; telephone (301) 504-7923.

Instructions: All submissions received must include the agency name and docket number for this proposed collection of information. All comments received may be posted without change, including any personal identifiers, contact information, or other personal information provided to <http://www.regulations.gov>. Do not submit confidential business information, trade secret information, or other sensitive or protected information electronically. Such information should be submitted in writing, with the sensitive portions clearly identified.

Docket: For access to the docket to read background documents or comments received, go to <http://www.regulations.gov>.

FOR FURTHER INFORMATION CONTACT: Robert (Jay) Howell, Associate Executive Director, Hazard Identification and Reduction, Consumer Product Safety Commission, 4330 East West Highway, Bethesda, MD 20814; telephone (301) 504-7621; email rhowell@cpsc.gov.

SUPPLEMENTARY INFORMATION:

I. Introduction

Except as provided in section 14(a)(2) of the CPSA, section 14(a)(1) of the CPSA, 15 U.S.C. 2063(a)(1), requires manufacturers and private labelers of a product that is subject to a consumer product safety rule (defined in section 3(a)(6) of the CPSA), or to any similar rule, ban, standard, or regulation under any other act enforced by the Commission, to issue a certificate. The certificate: (1) must certify, based on a test of each product or upon a reasonable testing program, that the product complies with all CPSC requirements and (2) must specify each rule, ban, standard, or regulation applicable to the product.

Section 14(a)(2) of the CPSA, 15 U.S.C. 2063(a)(2), requires manufacturers and private labelers of any children's product that is subject to a children's product safety rule to submit samples of the product, or samples that are identical in all material respects to the product, to a third party conformity assessment body accredited by CPSC to be tested for compliance with such children's product safety rule. Based on that testing, the manufacturer or private labeler must issue a certificate that certifies that such children's product complies with the children's product safety rule based on the assessment of a third party conformity assessment body accredited to conduct such tests. 15 U.S.C. 2063(a)(2)(B). The manufacturer or private labeler of the children's product must issue either a separate certificate for each applicable children's product safety rule or a combined certificate that certified compliance with all applicable children's product safety rules and specifies each such rule.

Section 14(g) of the CPSA contains additional requirements for these certificates. 15 U.S.C. 2063(f). Each certificate must identify the manufacturer or private labeler issuing the certificate and any third party conformity assessment body on whose testing the certificate depends. The certificate must include, at a minimum, the date and place of manufacture, the date and place where the product was tested, each party's name, full mailing address, telephone number, and contact information for the individual responsible for maintaining records of test results. Every certificate must be legible, and all required content must be in the English language. A certificate also may contain the same content in any other language.

Section 14(g) of the CPSA also states that every certificate must accompany the applicable product or shipment of products covered by the same certificate, and a copy of the certificate must be furnished to each distributor or retailer of the product. Upon request, the manufacturer or private labeler issuing the certificate must furnish a copy of the certificate to the Commission. The Commission has regulations, at 16 CFR 1110, specifying the parties responsible for issuing certificates, the form and content of certificates, and other requirements for certificates, including that certificates can be provided in electronic form.

This proposed rule would set forth the conditions and requirements for testing of component parts of consumer products, including children's products, where such testing is intended to demonstrate, in whole or in part, the product's compliance with any rule, standard, ban, or regulation enforced by the Commission that is subject to the requirements of section 14 of the CPSA and that does not itself directly address testing of component parts. Specifically, the proposed rule would establish the conditions under

which a party certifying a product under section 14 of the CPSA may rely on tests of component parts of the product, including materials used to produce it, as all or part of the basis for a valid certificate that the product complies with all applicable requirements enforced by the Commission. The proposed rule also would set out the conditions under which such tests of component parts can be conducted by persons other than the manufacturer, such as the manufacturer or supplier of the component parts. The proposed rule is consistent with earlier positions taken by the Commission (see: (1) a Statement of Policy: Testing of Component Parts with respect to Section 108 of the CPSIA, available on the Commissions website at <http://www.cpsc.gov/about/componenttestingpolicy.pdf>, which outlined the Commission's interim position on component testing of products containing plasticized component parts for phthalates; (2) a Statement of Policy: Testing and Certification of Lead Content in Children's Products, available on the Commissions website at <http://www.cpsc.gov/about/cpsia/leadpolicy.pdf>; (3) Guidance Document: Testing and Certification Requirements Under the Consumer Product Safety Improvement Act of 2008, available at <http://www.cpsc.gov/library/foia/foia10/brief/102testing.pdf>; (4) a notice regarding a Commission workshop on testing and certification published in the FEDERAL REGISTER on November 13, 2009, at 74 FR 58611, 58616; and (5) an Interim Enforcement Policy on Component Testing and Certification of Children's Products and Other Consumer Products to the August 14, 2000 Lead Limits (the Lead Limits Interim Enforcement Policy), available at <http://www.cpsc.gov/businfo/frnotices/fr10/comppol.pdf> and published in the FEDERAL

REGISTER on December 29, 2009 (74 FR 68593)) and the proposed rule also reflects the Commission's consideration of comments to those notices and to the workshop.

Elsewhere in this issue of the FEDERAL REGISTER, the Commission is issuing a proposed rule titled "Testing and Labeling Pertaining to Product Certification;" that proposed rule would address testing, continuing testing, and labeling requirements for consumer products, including children's products and would create a new 16 CFR part 1107. Component testing may help manufacturers meet their testing or continuing testing obligations under section 14 of the CPSA.

II. Description of the Proposed Rule

A. Introduction

The proposed rule would establish a new 16 CFR part 1109, setting forth the conditions under which the Commission will allow certification of consumer products based in whole or in part on testing of component parts or composite parts. The new part 1109 would consist of two subparts: Subpart A – General Conditions and Requirements, and Subpart B – Conditions and Requirements for Specific Consumer Products, Component Parts, and Chemicals.

B. Proposed Subpart A – General Conditions and Requirements

Proposed subpart A, consisting of §§ 1109.1 through 1109.5, would set out generally applicable conditions and requirements.

1. Scope – Proposed § 1109.1

Proposed § 1109.1 would define the scope of the rule as applying to all tests of component parts of consumer products where the test results are used to support a

certificate of compliance issued pursuant to section 14(a) of the CPSA or where the tests are otherwise required or permitted by section 14 of the CPSA.

2. Purpose – Proposed § 1109.2

Proposed § 1109.2 would discuss the rule’s purpose, which is to set forth the conditions and requirements under which the Commission will require or accept the results of testing of component parts of consumer products, instead of the entire consumer product, to meet, in whole or in part, the testing and certification requirements of sections 14(a), 14(b), and 14(d) of the CPSA.

3. Applicability – Proposed § 1109.3

Proposed § 1109.3 would specify that the rule applies to all manufacturers, importers, or private labelers and to the manufacturers or suppliers of component parts that: (1) are responsible for certifying products under section 14(a) of the CPSA or for continued compliance testing under section 14(d) of the CPSA; or (2) test component parts of consumer products to support a certification of compliance under section 14(a) of the CPSA or to comply with continuing testing requirements under section 14(d) of the CPSA.

4. Definitions – Proposed § 1109.4

Proposed § 1109.4 would define various terms used in the rule. For example, the proposal would define a component part, in part, as “any part of a consumer product, including a children’s product, that either must or may be tested separately from a finished consumer product, to assess the consumer product’s ability to comply with a specific rule, ban, standard, or regulation enforced by the CPSC.” As another example, proposed § 1109.4 would define a “certifier” as “the firm or firms responsible for

certifying compliance of a consumer product, or a component thereof, with all applicable rules, bans, standards, and regulations pursuant to part 1110 of this chapter, and any firm that voluntarily undertakes such responsibility.”

5. Conditions and Requirements Generally – Proposed § 1109.5

Proposed § 1109.5 would set out conditions and requirements that generally apply to all types of component part testing. Proposed § 1105.5(a)(1) would state that certifiers must rely on testing of a component part of a consumer product only where testing of the component part is required or sufficient to assess the consumer product’s compliance, in whole or in part, with an applicable rule, ban, standard, or regulation. For example, testing a component part of a children’s product for lead may be sufficient in situations where only the component part is known to contain or may contain lead. On the other hand, testing a component part of a consumer product for compliance with the small parts requirements of 16 CFR part 1501 will rarely, if ever, be appropriate, because the test procedure described at 16 CFR 1501.4 generally requires that the entire product be tested to determine whether small parts can be detached during the use or abuse of the entire product. Proposed § 1109.5(a)(1) also would specify that any doubts about whether testing one or more component parts of a consumer product can help to assess whether the entire product complies with applicable rules, bans, standards, and regulations should be resolved in favor of testing the entire product.

Proposed § 1109.5(a)(2) would require that the component part tested be identical in all material respects to the component used in the finished consumer product. Under this section, to be identical in all material respects to a component for purposes of supporting a certification of a children’s product, a sample need not necessarily be of the

same size, shape, or finish condition as the component part of the final product; rather, the sample may consist of any quantity that is sufficient for testing purposes and may be in any form that has the same content as the component part of the final product. For example, if a children's product manufacturer receives plastic resins from a supplier in an unfinished state, such as pellets, that are later molded into a component or a finished children's product in the manufacturing process, and the plastic resins need to be tested for phthalates, the children's product manufacturer may send samples of the plastic, either as pellets or in their finished state, to a third party conformity assessment body for testing. A certifier must exercise due care to ensure that no change in the component parts after testing and before distribution in commerce has occurred that would affect compliance, including contamination or degradation. Proposed § 1109.5(a)(2) also would state that manufacturers must exercise due care in the proper management and control of all raw materials, component parts, subassemblies, and finished goods for any factor that could affect the final product's compliance with all applicable rules. The manufacturer must exercise due care that the manufacturing process does not add the prohibited chemical from an untested source, such as the material hopper, regrind equipment, or other equipment used in the assembly of the finished product. Section 1109.4(f) of the proposed rule defines "due care" to mean the degree of care that a prudent and competent person engaged in the same line of business or endeavor would exercise under similar circumstances.

Under proposed § 1109.5(b), a certifier would not be able to rely on testing of a component part of a consumer product for any rule, ban, standard, or regulation that requires testing the entire consumer product to assess compliance.

Under proposed § 1109.5(c), certifiers and testing parties would be required to ensure that the required test methods and sampling protocols, as set forth in (proposed) 16 CFR part 1107, as well as any more specific applicable rules, bans, standards, regulations, or testing protocols, are used to assess compliance of the component part.

Proposed § 1109.5(d) would state that, subject to any more specific rule, ban, standard, or regulation, component part testing may occur before final assembly of a consumer product, provided that nothing in the final assembly of the consumer product can cause the component part or the consumer product to become noncompliant.

Proposed § 1109.5(e) would specify that certifiers may not rely on component part testing conducted by another testing party unless such component parts are traceable. Traceable is defined in proposed § 1109.4(i) as the ability of a certifier to identify the source of a component part, including the name and address of the entity providing the component part to the certifier.

Proposed § 1109.5(f) would require testing parties who are not themselves certifying a component part to provide the following documentation to a certifier:

- (1) identification or a description of the component part tested;
- (2) identification of a lot or batch number for which the testing applies;
- (3) identification of the applicable rules, bans, standards, and regulations for which each component part was tested;
- (4) identification or a description of the testing methods and sampling protocols used;
- (5) the date or date range when the component part was tested;
- (6) the results of each test on a component part; and

(7) if the product was tested by a third party conformity assessment body, regardless of whether it was required because the product is a children's product or whether the testing party chose to use such third party conformity assessment body, identification of such conformity assessment body, a copy of the original test results, and a certification that all testing was performed in compliance with section 14 of the CPSA and (proposed) part 1107 of this title.

The above information is needed so that if noncomplying products are found, the Commission can use this information to determine whether a certifier or third party conformity assessment body is not complying with the appropriate requirements.

Under proposed § 1109.5(g)(1), a certifier would not be able to rely on component part testing unless the certifier receives specific documentation from the testing party. If a certifier fails to obtain such documentation before certifying a consumer product under section 14(a) of the CPSA, we would consider the certifier to have failed to exercise due care as required by 15 U.S.C. 2068(a)(6).

Proposed § 1109.5(g)(2) would require any certification based in whole or in part on component part testing performed by a testing party, in addition to the certification requirements set forth in section 14(a) and (g) of the CPSA, to:

(1) Identify both the corresponding documentation required in proposed § 1109.5(a)(6) and any report provided by a third party conformity assessment body on which the consumer product's certification is based; and

(2) Certify that nothing subsequent to component part testing, for example, in the process of final assembly of the consumer product, changed or degraded the consumer

product such that it affected the product's ability to meet all applicable rules, bans, standards, and regulations.

Proposed § 1109.5(h) would require testing parties to maintain the documentation that would be required in proposed § 1109.5(f) for 3 years. Additionally, all certifiers would have to maintain records to support the traceability of component part suppliers for as long as the product is being distributed in commerce plus 3 years (except test records). Test records must be retained for 3 years. All records must be available in the English language. The documentation and records are needed to enable the Commission to investigate component part suppliers and certifiers if noncomplying yet certified products are found. We selected these record retention periods to be consistent with the record retention periods in proposed 16 CFR 1107.

Some requirements enforced by the Commission limit the content of certain chemicals in consumer products. These include the limits for lead content in children's products in section 101(a) of the CPSIA, the limit for lead content of paint and similar surface-coating materials in 16 CFR part 1303, the prohibition of more than 0.1 percent of certain phthalates in children's toys and child care articles in section 108 of the CPSIA, and the limitation of the amounts of compounds of antimony, arsenic, barium, cadmium, chromium, lead, mercury, or selenium in paints or other surface coatings in toys in section 4.3.5.2 of ASTM F 963 ("Standard Consumer Safety Specification for Toy Safety"). (Section 106(a) of the CPSIA states that the requirements of ASTM F 963 must be considered to be consumer product safety standards issued by the Commission under section of the CPSA.) The testing of component parts consists of three general categories: (1) testing for the levels of chemicals in paints or surface coatings; (2) testing

of actual component parts of a product to determine the content of chemicals in the component parts; and (3) testing of a combination of paints or surface coatings or a combination of component parts, which can reduce the number of tests required or the number of products needed to obtain a sample large enough to test (composite testing).

C. Proposed Subpart B – Conditions and Requirements for Specific Consumer Products, Component Parts, and Chemicals

1. Introduction

Proposed subpart B would consist of four provisions, §§ 1109.11 through 1109.14. The first three provisions discuss specific requirements for consumer products (namely chemicals in paint and lead and phthalates in products). The fourth provision concerns composite testing.

2. Proposed § 1109.11 – Lead in Paint and Surface Coatings

Proposed § 1109.11 would address component part testing for the levels of specified chemicals in paints or surface coatings. This aspect of the proposed rule is based on the Commission's previously published enforcement policy for testing products for compliance with lead limits. 74 FR 68593 (December 28, 2009).

Section 101(f)(1) of the CPSIA required the Commission to revise its preexisting regulation (at 16 CFR 1303.1) so that paints and similar surface coating materials having a lead content in excess of 0.009 percent of the weight of the total nonvolatile content of the paint or the weight of the dried paint film are banned hazardous products. (To simplify this discussion, we use the term "paint" broadly to include any type of surface coating that is subject to 16 CFR part 1303 or section 4.3.5.2 of ASTM F 963.) The new lower limit in 16 CFR part 1303 applies not only to paint sold to consumers as such (for

example, a gallon of paint sold at a hardware store), but also to any paint on toys or other articles for children and to any paint on certain household furniture items (not limited to children's furniture). See 16 CFR part 1303. The principles for testing paint subject to 16 CFR part 1303 also apply to the testing of paint and surface coatings for toys in section 4.3.5.2 of ASTM F 963.

In the case of paint and coatings, a manufacturer of a children's product can send samples of the final product to a third party conformity assessment body so that each type of paint may be scraped off and tested individually. However, where small amounts of a particular paint are used (such as painted eyes on a doll), under existing regulations, a large number of samples of the children's product may be needed to obtain enough of that paint to test.

Because compliance of a paint to its content limits is a function of the paint and not of the component part or substrate to which it is applied, proposed § 1109.11(a)(1) would allow testing of paint after it has been applied to any suitable substrate, in an appropriate quantity, and dried.

Proposed § 1109.11(a)(2) would provide that, for the tested paint to be identical in all material respects to that used in production of the consumer product, the paint samples tested must have the same composition as the paint used on the final product. For example, if a children's product manufacturer uses a drying agent that mixes with the paint, then the test sample should reflect this mixture. However, a larger quantity of the paint may be tested than is used on the consumer product, in order to generate a sufficient sample size. For example, a children's product manufacturer may spray paint a large surface area of a substrate with the paint product for the purposes of generating a

sufficient amount of paint for the sample. The paint may be supplied to the third party conformity assessment body either in liquid form or in the form of a dried film of the paint on any suitable substrate.

Proposed § 1109.11(a)(3) would require that the documentation required by a testing party pursuant to proposed § 1109.5(f) and the certificate of compliance required of certifiers under section 14(a) of the CPSA and proposed § 1109.5(g) identify each paint tested by color, location, specification number or other characteristic, the manufacturer of the paint, and the supplier of the paint (if different).

Proposed § 1109.11(a)(4) would state that the substrate used need not be of the same material as in the finished product nor have the same shape or other characteristics as the part of the finished product to which the paint will be applied.

Proposed § 1109.11(b) would state that, as part of its basis for certification of a children's product to the lead paint limit or other paint limit, a domestic manufacturer or importer may rely on a test report showing passing test results for one or more paints used on the product, based on testing performed by a listed third party conformity assessment body. (A listed third party conformity assessment body is an accredited testing facility that has met the Commission's requirements for testing products as the basis of certification that the product meets one or more applicable requirements enforced by the Commission. Such facilities are listed on the Commission's website.) The manufacturer of the children's product should ensure that each paint sample sent to a third party conformity assessment body is representative of that used on the final product. Test reports should identify each paint tested, by color, specification number, or other

characteristic, and identify the manufacturer of the paint and the supplier of the paint (if different).

Proposed §1109.11(c) would state that, as part of its basis for certification of a children's product to the lead paint limit or other paint limit, a certifier may rely on a certificate from another person certifying that paint complies with the lead limit. The paint certificate must be based on testing by a recognized third party conformity assessment body of samples of paints that are identical in all material respects to the paints used on the finished product. The paint certificate should identify all test reports underlying the certification.

Proposed § 1109.11(c) also would provide that any person who certifies a children's product as complying with the lead paint limit or other paint limit should be able to trace each batch of paint that is used on the product to the paint manufacturer. The product manufacturer should ensure that paints meeting the applicable limits are not later contaminated with lead from other sources before or during application to the product.

For consumer products that are not children's products but are subject to lead paint limits (such as certain furniture items), proposed § 1109.11(c) would provide that a domestic manufacturer or importer may base its certification to the lead paint limit on its own testing of each paint used on the product, on testing by any third party conformity assessment body, on paint certification(s) from any person, or on a combination of these methods. However, product manufacturers should ensure that paint meeting the applicable limits when tested and certified is not later contaminated with lead from other sources before or during application to the product.

3. Proposed § 1109.12 – Component part Testing for Lead Content of Children’s Products

a. Testing for Lead Content

On August 14, 2009, the general limit for lead in any accessible part of a children's product was reduced from 600 ppm to 300 ppm (see section 101(a)(2)(B) of the CPSIA). On that date, it became unlawful to sell, offer for sale, manufacture for sale, distribute in commerce, or import into the United States any product that is subject to the new lead limits, but fails to comply, regardless of when the product was made. Under section 101(a)(1) of CPSIA, any children's product containing an accessible part with lead above the limit is to be treated as a banned hazardous substance under the Federal Hazardous Substances Act. Section 101 of the CPSIA provides that the lead content limit for children’s products will be lowered to 100 ppm beginning August 14, 2011, unless the Commission finds that a limit of 100 ppm is not technologically feasible for a product or product category.

Currently, testing and certification is required for metal component parts of children’s metal jewelry. 73 FR 78331 (December 22, 2008); 74 FR 6396 (February 9, 2009). The certification must be based on testing by a third party conformity assessment body listed on CPSC's website as qualified to test for lead in children's metal jewelry (see www.cpsc.gov/cgi-bin/labapplist.aspx). If the children's metal jewelry bears paint, it must also be certified as in compliance with the 90 ppm limit. The requirement for testing and certification of other children’s products for lead content (except paint) has been stayed until February 10, 2011. 74 FR 68588 (December 28, 2009).

The Commission has determined that some materials, by their nature, will never exceed the lead content limits. These materials include many natural materials such as gemstones, wood, cotton, and wool, as well as certain refined metals and alloys. For a more complete list of such materials, see 74 FR 43031 (August 26, 2009). If all accessible parts of a children's product consist of such materials, then that product need not be tested or certified as in compliance with the lead content limits. The Commission recently issued a "Statement of Policy on Testing and Certification of Lead Content in Children's Products" (see 74 FR 5582 (Oct. 29, 2009)).

Since the lead content requirements for children's products apply to any accessible part of the product, testing of the children's product's component parts may be required. The Commission has promulgated a final rule for determining when parts of a children's product may be deemed inaccessible and do not need to be tested for lead content. 16 CFR 1500.87; 74 FR 39535 (August 7, 2009). Neither paint nor electroplating may be considered as making underlying materials inaccessible (see section 101(b)(3) of the CPSIA).

b. Certification of Children's Products Subject to Lead Content Requirements

Children's products, other than children's metal jewelry or those made of materials that, by their nature, will never exceed the lead content limits, must be certified as being in compliance with the 300 ppm lead content limit only if they are manufactured after February 10, 2011, and only as to accessible parts that are not subject to a Commission determination. Pursuant to section 14(a)(2) of the CPSA, the certification

must be based on testing by a third party conformity assessment body listed on CPSC's website as qualified to test for lead in children's products.

Thus, proposed § 1109.12 would describe requirements pertaining to component part testing of children's products to determine their lead content. Proposed § 1109.12(a) would explain that a certifier may rely on component part testing of each accessible part of a children's product provided that:

- the determination of which, if any, parts are inaccessible pursuant to section 101(b)(2) of the CPSIA is based on an evaluation of the final product; and
- for each accessible component part of the product, the certifier either has a component part test report or a component part certificate.

Proposed § 1109.12(b) would state that, as part of its basis for certification of a children's product to the lead content limit, a certifier may rely on a test report showing passing test results for one or more component parts used on the product, based on testing by a recognized third party conformity assessment body. The proposal would require the test reports to identify each component part tested, by part number or other specification, as well as the manufacturer of the component part and the supplier (if different).

Proposed § 1109.12(c) would address component part certificates. The proposal states that, as part of its basis for certification of a children's product to the lead content limit, a certifier may rely on a certificate from another person certifying that a component part complies with the lead limit. The component part certificate would have to be based on testing of a representative sample of the component part(s) by a recognized third party conformity assessment body. The proposal would require the component part certificate

to identify all test reports underlying the certification consistent with section 14 of the CPSA.

Under proposed § 1109.12(d), the certificate accompanying the children's product would have to list each component part tested, by part number or other specification, and for each such part identify the corresponding test report or component part certificate on which product certification is based.

4. Proposed § 1109.13 – Component part Testing for Phthalates in Children's Toys and Child Care Articles

Section 108 of the CPSIA permanently prohibits the sale of any children's toy or child care article containing concentrations of more than 0.1 percent of three specified phthalates. Section 108 of the CPSIA also prohibits, on an interim basis, the sale of any children's toy that can be placed in a child's mouth or child care article containing concentrations of more than 0.1 percent of three additional phthalates, pending the recommendation of a Chronic Hazard Advisory Panel. These prohibitions became effective on February 10, 2009.

The Commission has stayed the requirement for testing and certification for the phthalate content requirements until 90 days after the Commission publishes a notice of requirements for accrediting conformity assessment bodies to test to the phthalate content requirements. 74 FR 68588 (December 28, 2009).

In general, phthalates are chemicals added to plastic to make the plastic more flexible or resilient, and concerns have been raised about possible adverse health effects resulting from exposure to phthalates. In March 2009, the Commission's staff sought comment on a method for testing phthalate content as a percentage of the entire toy or

child care article. Testing the phthalate content of an entire children's toy or child care article may present certain difficulties. For example, the risk presented by phthalates in a component part may not be adequately described if the percentage concentration of phthalates is determined in comparison to the whole product, which may have other component parts that do not contain phthalates. In an extreme example, a product that has a plasticized component part that had a phthalate concentration above 0.1 percent arguably could be brought into compliance with the phthalate limit by adding more non-plasticized material and thus "dilute" the concentration of phthalates in the whole product. However, this approach would not reduce the risk posed by the concentration of phthalates in the component part. Testing only the plasticized component parts would avoid such "dilution" scenarios, is more protective of human health, and is consistent with the CPSIA's goal of limiting children's exposure to phthalates. The benefits of the component part approach are two-fold; in addition to providing more protection for children, it also may significantly reduce the testing costs for manufacturers in certain circumstances.

Proposed § 1109.13(a) would reflect our position regarding component part testing for phthalates by stating that a certifier may rely on component part testing of appropriate component parts of a children's toy or child care article for phthalate content if the certifier is provided with a copy of the original test results obtained from the third party conformity assessment body.

Proposed § 1109.13(b) would state that, as part of its basis for certification of a children's product to the phthalate content limit, a certifier may rely on a test report showing passing test results for one or more component parts used on the product, based

on testing by a recognized third party conformity assessment body. Component part test reports should identify each component part tested, by part number or other specification, and the manufacturer and the supplier of the component part (if different).

Proposed 1109.13(c) would state that, as part of its basis for certification of a children's product to the phthalate content limit, a certifier may rely on a certificate from another person certifying that a component part complies with the limit. The component part report should be based on testing of a representative sample of the component parts by a CPSC-recognized third party conformity assessment body. The component part certificate should identify all test reports underlying the certification required by section 14 of the CPSA. Any person who certifies a children's product as complying with the phthalate content limits should be able to trace each component part of the product to the component part's manufacturer.

Proposed § 1109.13(d) would require that the certificate accompanying the children's toy should list each component part tested by part number or other specification and, for each such part, identify the corresponding test report or component part certificate on which product certification is based.

5. Proposed § 1109.14 - Composite Part Testing

Composite testing is where more than one paint or surface coating, or more than one component part, are combined and the combination is tested for the level of the target chemical. This can reduce the number of tests required or the number of products needed to obtain a sample large enough to test (composite testing). For example, if different parts of a doll are painted with small amounts of different paints, the paints could be mixed together and tested for lead. Proposed § 1109.14 addresses composite testing and

consists of three subsections, one dealing with tests of composite paints and surface coatings, one dealing with tests of composite component parts, and one dealing with how to ensure that no failure to comply with the chemical content limits will go undetected.

Proposed § 1109.14(a) would state that, in testing paints for compliance with chemical content limits, testing parties may test a combination of different paint samples so long as they follow procedures ensuring that no failure to comply with the lead limits will go undetected. For an example of an acceptable methodology, see Test Method CPSC-CH-E1003-09, Standard Operating Procedure for Determining Lead (Pb) in Paint and Other Similar Surface Coatings (April 26, 2009) (available on the Internet at <http://www.cpsc.gov/about/cpsia/CPSC-CH-E1003-09.pdf>). Proposed § 1109.14(a) also would require testing and certification of composite paints to comply with § 1109.11.

Proposed § 1109.14(b) would allow a third party conformity assessment body to test a combination of plastic component parts or a combination of metal component parts so long as the third party conformity assessment body follows procedures ensuring that no failure to comply with the lead limits will go undetected. The proposal would require such testing and certification of component parts to comply with proposed § 1109.12 for the lead content of children's products or with proposed § 1109.13 for the phthalate content of children's toys and child care articles.

When using composite testing, only the total amount of the target chemical is determined, not how much was in each individual paint or component part. Therefore, to determine that each paint or component part is within the applicable limit, proposed § 1109.14(c) would provide that the entire amount of the target chemical in the composite is attributed to each paint or component part. If this method yields an amount of the

target chemical that exceeds the limit applicable to any paint or component part in the composite sample, additional testing would be required to determine which of the paints or component parts (if any) fails to meet the applicable limit.

III. Previous Guidance on Component Part Testing and Requests for Comment

Between 2008 and December 28, 2009, the Commission discussed component part testing issues, either generally or regarding specific substances (such as lead and phthalates), and invited comment. We also held a public workshop on issues relating to product testing, including component part testing (see 74 FR 58611 (November 13, 2009)). In brief, the previous activities on component part testing have consisted of the following:

First, the Commission's staff posted a document on the Commission's website explaining the new requirements for third party testing of children's products and requesting comments on a number of issues related to component part testing. That document is available at

<http://www.cpsc.gov/about/cpsia/ComponentPartsComments.pdf> . The comment period closed on January 30, 2009.

Second, on August 7, 2009, the Commission issued a Statement of Policy: Testing of Component Parts with respect to Section 108 of the CPSIA, available at <http://www.cpsc.gov/about/componenttestingpolicy.pdf>. The August 7, 2009, Statement of Policy outlined the Commission's interim position on component part testing of products containing plasticized component parts for phthalates. In the FEDERAL

REGISTER of August 17, 2009 (74 FR 4140), the Commission invited comments on the Statement of Policy. The comment period closed on September 16, 2009.

Third, in October 2009, the Commission issued a Statement of Policy: Testing and Certification of Lead Content in Children's Products (), available at <http://www.cpsc.gov/about/cpsia/leadpolicy.pdf>. The October 2009 Statement of Policy on lead content addressed component part testing for lead in children's products and provided that component part testing could be used to test for compliance with the 300 ppm lead content limit, especially in circumstances where a product is made up of several substances, some of which will not, by their nature, contain lead, or where lead containing parts are inaccessible.

Fourth, on November 3, 2009, CPSC staff issued a proposed Guidance Document Testing and Certification Requirements Under The Consumer Product Safety Improvement Act of 2008 (available at <http://www.cpsc.gov/library/foia/foia10/brief/102testing.pdf>). The proposed Guidance Document set forth the CPSC staff's proposed interpretation of the testing and certification requirements established in section 102 of the CPSIA. Although the Commission did not vote on this document, the document provided the framework for the December 10-11, 2009, workshop on testing and certification requirements under section 14 of the CPSA. The Guidance Document addressed component part testing in sections III.C and III.D of the document, as well as in section IV on Questions and Answers, in questions 14 through 20. Moreover, component part testing was discussed in several sessions at the December 10-11, 2009, workshop on testing and certification requirements. Stakeholders were able to submit comments on our proposed interpretation

of section 14 of the CPSA with regard to testing of component parts and on the discussion on component part testing at the December workshop by submitting comments on the workshop. We invited written comments on the December 2009 workshop and testing and certification issues through January 11, 2010, in a notice announcing the workshop that appeared in the FEDERAL REGISTER of November 13, 2009, at 74 FR 58611, 58616. We summarize and respond to these comments in section IV of this document below.

Fifth, on December 16, 2009, the Commission approved an Interim Enforcement Policy on Component Testing and Certification of Children's Products and Other Consumer Products to the August 14, 2000 Lead Limits (available at <http://www.cpsc.gov/businfo/frnotices/fr10/comppol.pdf> . The Lead Limits Interim Enforcement Policy was published in the FEDERAL REGISTER on December 29, 2009 (74 FR 68593).

Finally, a petition was filed with the Commission seeking recognition of various methods of component part testing for lead in paint. The petition seeks approval for three methods of testing for lead in paint on component parts of a consumer product. In a notice that appeared in the FEDERAL REGISTER of December 29, 2009 (74 FR 68596), we invited comments on the petition. The comment period ended on February 26, 2010.

Any final rule arising out of this notice of proposed rulemaking is intended to supersede all policy statements and guidelines referred to above in this section III *as they apply to testing of component parts*. To the extent component part testing is not addressed by another CPSC-enforced rule, regulation, standard, or testing protocol, the Commission intends that this proposed rule, if finalized, shall apply. In general, certifiers

should test and certify consumer products, including children's products, based on the most specific regulation that applies to such consumer product.

IV. Comments on Component Part Testing and the CPSC's Responses

As described in section II of this document above, we have invited and received comments on a number of documents relating to component part testing and at a public workshop. All of these documents were publicly available before the end of the comment period associated with the workshop held by the Commission on December 10-11, 2009. See 74 FR 58611 (November 13, 2009). The comment period for the workshop ended on January 11, 2010. During that comment period, we received 27 comments relating to testing of component parts of regulated products. Because the comment period for the workshop was the latest opportunity for interested parties to submit comments, and because the comments received cover the issues raised by previous comments, we now address only the comments received between November 13, 2009 (the date on which we issued a FEDERAL REGISTER notice announcing the workshop) and January 11, 2010 (the closing date of the comment period for the workshop). To make it easier to identify comments and responses, the word "Comment" will precede each topic addressed by the comments, and the word "Response" will precede each response to a topic. We also have numbered each topic to make it easier to identify and distinguish comments. The number assigned to each topic is for organizational purposes and does not signify the comment's value, importance, or order in which it was received.

Comment 1 - Almost all persons who commented on component part testing favored it. Many commenters acknowledged the benefit of component part testing to small

businesses. The commenters cited component part testing as a way to reduce redundant testing when a particular component part is used in multiple products. They also wanted the option of component part testing when the amount of the component part in the final product is small and testing of the final product requires destruction of a large number of units to collect a sufficient quantity of the component part to be tested. Several commenters indicated that testing at the component part level may reduce costs associated with reworking products that do not meet safety standards due to a noncompliant component part.

Response - We view component part testing, when appropriate, as a cost-effective option to facilitate assurance of compliant consumer products. A certifier may choose testing of a component part, which by its construct or materials is subject to a consumer product safety rule under the CPSA, or a similar rule, ban, standard, or regulation under any other act enforced by the Commission, when the component part is not altered during the manufacturing process. Tested component parts must be representative of those used in a final product, and certified component parts in a final product must be able to be traced back to their certificates.

Comment 2 - Commenters had different opinions concerning who should conduct component part testing and whether a certification provided by a supplier can be used. One commenter suggested that component part testing be limited to the final product manufacturer, and not be available to component part suppliers, many of whom, according to the commenter, are located in foreign countries. The commenter's concern is that supply chain integrity might not always be maintained and untested or counterfeit component parts could be introduced into a manufacturer's production. Other

commenters suggested that product manufacturers should be able to use testing results obtained from component part suppliers or manufacturers, rather than requiring the product manufacturer to test each component part separately. Three commenters indicated that the supplier who certifies a component part, and not the manufacturer that uses the supplier-certified component part, should be held liable for noncompliance.

Response - Excluding the option of using supplier- provided component part certificates may unduly burden some manufacturers or importers. Where appropriate, manufacturers or importers may rely on certificates received from suppliers of component parts as the basis for issuance of their own certificates for the finished product. See section 19(b) of the CPSA. However, under section 19(a)((6) of the CPSA, certifiers may be charged with issuing a false certificate if, in the exercise of due care, they would have had reason to know that a certificate upon which they relied was false or misleading in any material respect. Therefore, manufacturers or importers who rely on a certification from a component part supplier should apply sound business practices when electing to use the component part suppliers' certification. Ultimately, the domestic manufacturer or importer is responsible for compliance of its final product.

Comment3 - Other commenters suggested that, to protect against counterfeit supplier component part certifications, CPSC should set up an annual review process of the laboratories that it recognizes to prevent such falsifications.

Response – We disagree with the commenters. Section 14(a)(2)(B)(iii) of the CPSA requires the Commission to issue protocols and standards for verifying that a children's product tested by a CPSC-recognized third party conformity assessment body complies

with applicable children's products safety rules. This verification may help deter the issuance of false certifications by suppliers.

Moreover, nothing in this rule requires a manufacturer to accept a certification provided by a supplier. A manufacturer is always free to have the component part or the product tested and then issue a certificate for the product based on tests conducted by the manufacturer (in the case of non-children's products) or by a third party conformity assessment body (in the case of children's products).

If the concern is whether manufacturers will be unable to distinguish between genuine and counterfeit certificates purporting to come from a specific component part supplier, we note that suppliers themselves can take steps to deter or reduce counterfeiting. For example, a supplier concerned about counterfeit certificates could add various security features, such as color-shifting ink, microprinting, and holograms, to its certificates to make counterfeiting more difficult.

Comment 4 - One commenter suggested that we establish different requirements for different component parts based on their inherent safety risks. Component parts presenting the least risk would be exempt from mandatory third party testing.

Response -In the CPSIA, Congress set the chemical content levels applicable to children's products. The CPSIA does not provide that component parts presenting a real, albeit low, risk can be exempted from the requirements for third party testing.

Comment 5 - Many commenters stated that reliance on component part testing requires that the tested component parts be representative of those used in the final product and that adequate traceability of component parts is maintained. One commenter stressed the need to prepare component part samples (such as a large representative paint

sample substituted for a sample obtained by scraping paint from a large number of products each with only a tiny amount of paint) using the same technique and equipment that is used for the products. Some commenters were concerned that, subsequent to testing, raw materials (e.g., premolded plastic pellets or wet paint in the can) could be contaminated in the production process, resulting in the manufacture of noncompliant products. If, for example, wet paint is found to be compliant, the commenter stated, the drying process could evaporate enough solvent to raise the concentration above the allowable limit. Another commenter stated that compositing of similar materials should be valid, so long as the acceptance limit for the test is adjusted downward to account for multiple materials being tested.

Response – Under the proposed rule, testing of component parts is an option when the component part is not altered during the process of assembling the final product. If during processing or assembly of the component part into the final product, there is a chance that the component part could be contaminated or changed in such way that it is no longer compliant with the applicable safety rule(s), the manufacturer or importer should test the final product, or its component parts for compliance. Component part samples must be identical in all material respect to the component parts that will be used in the final product. Component part testing of composited samples is acceptable provided the subsequent procedures will ensure that no failure to comply with a limit will go undetected. An example of an acceptable procedure is provided in CPSC-CH-E1003-09, Standard Operating Procedure for Determining Lead (Pb) in Paint and Other Similar Surface Coatings (available on the Commission’s website at <http://www.cpsc.gov/about/cpsia/CPSC-CH-E1003-09.pdf>) . We note that the criteria for

lead content refer to the percentage of lead (calculated as lead metal) by weight of the total nonvolatile content of the paint or the weight of the dried paint film. Thus, the commenter's concern about evaporation of solvents from the paint increasing the lead concentration is unwarranted.

Additionally, under the proposed rule, domestic manufacturers and importers would have to maintain documents that demonstrate the traceability of certified materials in their products.

Comment 6 - Several commenters noted that many component parts are not children's products until they are actually incorporated into a completed product. To these commenters, mandatory third party testing of all component parts that might be used in a children's product would be inefficient and wasteful. The commenters added that component part suppliers often do not know whether their component part will be used in the manufacture of other products.

Response – Under the proposal, a component part supplier may, but is not required to, subject its component part to third party testing and/or certification (assuming that the component part becomes part of a children's product). Similarly, manufacturers may, but are not required to, decide whether to purchase third party certified component parts from a supplier or whether to conduct third party testing and certification at the component part or final product level. The proposed rule would not require third party testing or certification of component parts that are not used in children's products.

Comment 7 - One commenter suggested that reasonable attestations from raw material manufacturers should be used in determinations on whether or not to test for phthalates. The commenter contended that third party tests by an accredited third party

conformity assessment body should not be required. The commenter argued that, as part of a reasonable testing program, assurances provided by suppliers that plastic resins meet Food and Drug Administration (FDA) requirements should be considered as a basis to reduce the amount of periodic testing of toys or children's products, or component parts thereof, made from food-grade plastics. Further, the commenter suggested excluding the limits or requirement for testing for inaccessible component parts that may contain phthalates, similar to the exclusion for lead.

Response - We will consider these comments as part of any rulemaking activity for phthalates. However, neither section 14 of the CPSA nor section 108 of the CPSIA contains an exclusion for products that happen to meet FDA requirements.

Comment 8 - Many commenters mentioned that manufacturers with very small production quantities would not be able to afford the destructive testing of a significant percentage of their production. Another commenter mentioned that destructive testing of gold jewelry is very expensive and that component part testing would alleviate that situation.

Response - The concerns of these commenters are addressed by the proposed rule, since component part testing can eliminate or reduce the need to test the finished product.

Comment 9 - One commenter stressed that some component parts require testing of the completed product to evaluate compliance to the applicable rules.

Response - We agree with the comment. Many CPSC rules may require testing of a finished product. The proposed rule would not disturb any preexisting regulation that requires testing of a finished product.

Comment 10 - One commenter said that precertified component parts should also be allowed as part of a reasonable testing program. The supplier would undertake third party testing and supply a copy of its certificate to the manufacturer. No additional testing on the component parts should be required.

Response - A manufacturer may rely upon a supplier's certification of a component part, provided that the component part is not altered during the assembly of the final product. The manufacturer must exercise due care to determine that the supplier's certificate is not false or misleading in any material respect and must maintain traceability of component parts. The manufacturer is ultimately responsible for the final product's compliance to CPSC's safety rules.

Comment 11 - One commenter stated that component part testing with production process control measures should be acceptable as verification to issue a general certificate of conformity.

Response – Proposed part 1109 allows component part testing in appropriate circumstances. Requirements for a reasonable testing program sufficient to support a general certificate of conformity are addressed in the proposed rule titled “Testing and Labeling Pertaining to Product Certification,” which is published elsewhere in this issue of the FEDERAL REGISTER.

V. Environmental Considerations

Generally, the Commission's regulations are considered to have little or no potential for affecting the human environment, and environmental assessments and impact statements are not usually required. See 16 CFR 1021.5(a). The proposed rule

contains the Commission's conditions and requirements for testing of component parts of consumer products to support, in whole or in part, a certificate that a consumer product complies with all applicable rules, bans, standards, and regulations, pursuant to section 14(a) of the CPSA and to ensure continued compliance pursuant to section 14(d) of the CPSA. As such, the proposed rule is not expected to have an adverse impact on the environment. The rule falls within the categorical exclusion in 16 CFR 1021.5(b)(2) for product certification rules. Accordingly, no environmental assessment or environmental impact statement is required.

VI. Initial Regulatory Flexibility Analysis

The Regulatory Flexibility Act (RFA), 5 U.S.C. 601-612, generally requires that agencies review proposed rules for their potential economic impact on small entities, including small businesses. The RFA calls for agencies to prepare and make available for public comment an initial regulatory flexibility analysis describing the impact of the proposed rule on small entities and identifying impact-reducing alternatives. 5 U.S.C. 603. The proposed rule defines conditions upon which the certifier (the manufacturer or importer) can rely upon tests conducted on component parts of the product, rather than on the whole product, as the basis for the certification. This section discusses the impact that the draft proposed rule would have on small businesses.

In the absence of component part testing, certifiers of children's products would have to obtain test results for each component part of a consumer product even if the same component part were used in more than one consumer product. Component part testing will allow the certifier to rely upon tests conducted on the component part to

certify that the final product meets the applicable safety rules. Because testing costs are relatively fixed, component part testing allows the cost of the testing to be spread over more units of finished goods. This can significantly reduce the cost of testing and certifying products.

For example, a manufacturer that uses the same paint on five different products could obtain test results for the paint and use those results to certify that the same paint, when used on each of the five products, complies with the applicable safety rules (provided that nothing is added to the paint after the testing or during the application process). Without component part testing, the manufacturer would have to test the paint on each product on which it is used, which would increase the costs of testing by a factor of about 5.

Because component part testing can significantly reduce the cost of testing, the proposed rule would reduce, but not eliminate, the economic impact that the testing and certification requirements of the CPSIA may have on manufacturers and importers of consumer products subject to consumer product safety rules.

VII. Paperwork Reduction Act

This proposed rule contains information collection requirements that are subject to public comment and review by the Office of Management and Budget (OMB) under the Paperwork Reduction Act of 1995 (44 U.S.C. 3501-3520). We describe the provisions in this section of the document with an estimate of the annual reporting burden. Our estimate includes the time for reviewing instructions, searching existing data

sources, gathering and maintaining the data needed, and completing and reviewing each collection of information.

We invite comments on: (1) Whether the collection of information is necessary for the proper performance of the CPSC's functions, including whether the information will have practical utility; (2) the accuracy of the CPSC's estimate of the burden of the proposed collection of information, including the validity of the methodology and assumptions used; (3) ways to enhance the quality, utility, and clarity of the information to be collected; and (4) ways to minimize the burden of the collection of information on respondents, including through the use of automated collection techniques, when appropriate, and other forms of information technology.

The proposed rule would require certifiers to maintain records on the source of component parts tested for compliance to ensure traceability of component parts. If a component part is tested by a party other than the manufacturer or importer of the final product (the certifier), the proposed rule would require that the testing party provide certain documentation or records to the certifier. These records include identification of a lot or batch number for which the testing applies; what applicable rules, bans, standards, and regulations it tested for on each component part tested; what testing methods and sampling protocols were used; the date or date range the component part was tested; the results of each test on a component part; if the product was tested by a third party conformity assessment body, identification of such third party conformity assessment body, and a copy of the original test results; and a certification that all testing was performed in compliance with section 14 of the CPSA and part 1107 of this title, as applicable.

These records are similar to the records that a manufacturer would be required to develop and maintain under the proposed rule on “Testing and Labeling Pertaining to Product Certification” (which appears elsewhere in this issue of the FEDERAL REGISTER). Most of the records concern the documentation of the test plan and test results for the component part, which would be required whether the component part was tested as part of the final product or apart from the final product. Even without component part testing, certifiers would be expected to maintain records regarding the lot, batch, or other information identifying the component parts used, since changes in the component part or the sourcing of the component part would constitute a material change and trigger requirements for additional testing.

The proposed component part testing rule may shift the responsibility for preparing the records, especially those documenting the test results, in some cases, from the manufacturer or importer of the consumer product to the manufacturer of the component part.

We do not know how many manufacturers or wholesalers will voluntarily test component parts for manufacturers of children’s products. Component part manufacturers that are not themselves manufacturers of children’s products, but could voluntarily obtain the required third party testing for children’s product manufacturers who use their component parts. Such manufacturers might include textile manufacturers, paint and coating manufacturers, manufacturers of buttons and other fasteners, and manufacturers of plastics material and resin. The 2007 Economic Census showed that there were 5,220 establishments that were engaged in manufacturing these materials or

component parts. However, the number who would actually obtain third-party testing will probably be a small subset of these establishments.

At this time, there is no clear basis for estimating the recordkeeping burden on component part suppliers that voluntarily obtain the third party testing. We note that, in the proposed rule titled, “Testing and Labeling Pertaining to Product Certification” (which appears elsewhere in this issue of the FEDERAL REGISTER), we tentatively estimated that the total recordkeeping burden for that proposal with respect to the the continued testing requirements of the CPSIA would be 200,000 to 300,000 hours annually. Some of this burden cannot be shifted to the component part suppliers because some tests must be performed on the whole product. In other cases, the burden will not be shifted because the component part is unique to the product or the manufacturer or because the component part supplier declines to obtain the third party testing. However, if we assume that eventually 10% of the total testing were ultimately shifted to the component part suppliers, then the recordkeeping burden shifted would be approximately 20,000 to 30,000 hours. The total cost of the burden shifted would be \$0.9 million to 1.5 million. This estimate was obtained by multiplying the total hour burden estimates by \$48.91, which is the total hourly compensation for private sector workers in management, professional, and related occupations. The actual cost burden would depend upon the extent to which component suppliers are willing to voluntarily obtain the third party testing.

In compliance with the Paperwork Reduction Act of 1995 (44 U.S.C. 3507(d)), the CPSC has submitted the information collection requirements of this rule to OMB for review. Interested persons are requested to fax comments regarding information

collection by [insert date 30 days after date of publication in the FEDERAL REGISTER], to the Office of Information and Regulatory Affairs, OMB (see ADDRESSES).

VIII. Executive Order 12988 (Preemption)

According to Executive Order 12988 (February 5, 1996), agencies must state in clear language the preemptive effect, if any, of new regulations. Section 26 of the CPSA only addresses the preemptive effect of consumer product safety standards under the CPSA. The current rule is not a consumer product safety standard under the CPSA. Accordingly, this rule does not fall within the scope of any provision of any act enforced by the Commission that grants preemptive effect to rules.

IX. Effective Date

The Administrative Procedure Act (APA) generally requires that the effective date of a rule be at least 30 days after publication of a final rule. 5 U.S.C. 553(d). The Commission intends that any final rule based on this proposal would become effective 180 days after the date of publication of a final rule in the FEDERAL REGISTER. This should allow time for any product changes needed for testing of component parts and for implementation of the component part testing requirements.

X. Request for Comments

Although the CPSC has, on several occasions, invited and received comments on component part testing, the issuance of this proposed rule begins a rulemaking proceeding under sections 3 and 102 of the CPSIA which will establish the conditions

and requirements for testing of component parts of consumer products to demonstrate, in whole or in part, compliance of a consumer product with all applicable rules, bans, standards, and regulations. We invite interested persons to submit comments on any aspect of the proposed rule. Comments should be submitted in accordance with the instructions in the ADDRESSES section at the beginning of this notice.

1109.13 Component Part Testing for Phthalates in Children's Toys and Child Care

Articles

1109.14 Composite Testing

AUTHORITY: Secs. 3 and 102, Pub. L. 110-314, 122 Stat. 3016; 15 U.S.C. 2063.

Subpart A - General Conditions and Requirements

§ 1109.1 Scope.

This part applies to all tests of component parts of consumer products where the test results are used to support a certificate of compliance issued pursuant to section 14(a) of the Consumer Product Safety Act (CPSA) or where the tests are otherwise required or permitted by section 14 of the CPSA. The requirements of this subpart A apply to the consumer products, component parts, and chemicals subject to subpart B of this part.

§ 1109.2 Purpose.

The purpose of this part to set forth the conditions and requirements under which the Commission will require or accept the results of testing of component parts of consumer products, instead of the entire consumer product, to meet, in whole or in part, the testing and certification requirements of sections 14(a), 14(b), and 14(d) of the CPSA.

§ 1109.3 Applicability.

The provisions of this part to all manufacturers, importers, and private labelers, and to the manufacturers and suppliers of component parts who are responsible for certifying consumer products under section 14(a) of the CPSA and continued compliance under section 14(d) of the CPSA or who are responsible for testing component parts of consumer products to support a certification of compliance under section 14(a) of the CPSA or to comply with continuing testing requirements under section 14(d) of the CPSA.

1109.4 Definitions. The following definitions apply to this part :

(a) *Certifier* means the firm or firms responsible for certifying compliance of a consumer product, or a component part thereof, with all applicable rules, bans, standards, and regulations pursuant to part 1110 of this title, and any firm that voluntarily undertakes such responsibility.

(b) *Component part* means any part of a consumer product, including a children's product, that either must or may be tested separately from a finished consumer product to assess the consumer product's ability to comply with a specific rule, ban, standard, or regulation enforced by the CPSC. Within the same consumer product, which component parts will have to be tested may vary, depending on the test being conducted.

(c) *CPSA* means the Consumer Product Safety Act.

(d) *CPSC* means the Consumer Product Safety Commission.

(e) *CPSIA* means the Consumer Product Safety Improvement Act of 2008.

(f) *Due care* means the degree of care that a prudent and competent person engaged in the same line of business or endeavor would exercise under similar circumstances.

(g) *Paint* means any type of surface coating that is subject to part 1303 of this chapter or section 4.3.5.2 of ASTM F 963].

(h) *Testing party* means the firm or firms, including but not limited to domestic manufacturers, foreign manufacturers, importers, private labelers, third party conformity assessment bodies, or component part suppliers who test a consumer product, or any component part thereof, for compliance, in whole or in part, with any applicable rule, ban, standard, or regulation enforced by the CPSC.

(i) *Traceable* means the ability of a certifier to identify the source of a component part of a consumer product, including the name and address.

§ 1109.5 Conditions and Requirements Generally.

(a) *Component part testing allowed.* A certifier may certify compliance of a consumer product with all applicable rules, bans, standards, and regulations as required by section 14(a) of the CPSA, and may ensure continued compliance of children's products pursuant to section 14(d) of the CPSA, based, in whole or in part, on testing of a component part of the consumer product conducted by the certifier and/or a testing party if the following requirements are met:

(1) testing of the component part is required or sufficient to assess compliance, in whole or in part, of the consumer product with the applicable rule, ban, standard, or regulation. Any doubts about whether testing one or more component parts of a

consumer product can help to assess whether the entire product complies with applicable rules, bans, standards, and regulations should be resolved in favor of testing the entire product; and

(2) the component part tested is identical to the component parts used in the finished consumer product in all material respects. To be identical in all material respects to a component part for purposes of supporting a certification of a children's product to the applicable content limit, a sample need not necessarily be of the same size, shape, or finish condition as the component part of the final product; rather, it may consist of any quantity that is sufficient for testing purposes and in any form that has the same content as the component part of the final product. A certifier must exercise due care to ensure that no change in the component parts after testing and before distribution in commerce has occurred that would affect compliance, including contamination or degradation. Final consumer product manufacturers must exercise due care in the proper management and control of all raw materials, component parts, subassemblies, and finished goods for any factor that could affect the final product's compliance with all applicable rules. The manufacturer must exercise due care that the manufacturing process does not add the prohibited chemical from an untested source, such as the material hopper, regrind equipment, or other equipment used in the assembly of the finished product.

(b) *Limitation.* A certifier must not rely on testing of a component part of a consumer product for any rule, ban, standard, or regulation that requires testing the entire consumer product to assess compliance.

(c) *Test method and sampling protocol.* Regardless of which entity performs component part testing or selects samples for component part testing, both certifiers and

testing parties must ensure that the required test methods and sampling protocols, as set forth in part 1107 of this chapter, as well as any more specific applicable rules, bans, standards, regulations, or testing protocols, are used to assess compliance of the component part.

(d) *Timing.* Subject to any more specific rule, ban, standard, or regulation, component part testing may occur before final assembly of a consumer product provided that nothing in the final assembly of the consumer product can cause the component part or the final consumer product to become noncompliant.

(e) *Traceability.* Certifiers must not rely on component part testing conducted by another testing party unless such component parts are traceable.

(f) *Documentation by testing party.* Unless the testing party is the certifier, a testing party must provide the following documentation to a certifier:

- (1) identification of the component part tested;
- (2) identification of a lot or batch number for which the testing applies;
- (3) identification of the applicable rules, bans, standards, and regulations it tested for on each component part tested;
- (4) identification of the testing methods and sampling protocols were used;
- (5) the date or date range when the component part was tested;
- (6) the results of each test on a component part; and
- (7) if the product was tested by a third party conformity assessment body, regardless of whether it was required because the product is a children's product or whether the testing party chose to use such third party conformity assessment body, identification of such testing laboratory, a copy of the original test results, and a

certification that all testing was performed in compliance with section 14 of the CPSA and part 1107 of this chapter.

(g) *Certification.* (1) A certifier must not rely on component part testing by a testing party unless it receives the documentation under paragraph (f) of this section from the testing party. A certifier who does not obtain such documentation before certifying a consumer product may be considered to have not exercised due care as required by section 19(a)(6) of the CPSA.

(2) Any certification of a consumer product based, in whole or in part, on component part testing performed by a testing party must:

(A) identify both the corresponding documentation required in paragraph (f) of this section and any report provided by a third party conformity assessment body on which the consumer products certification is based; and

(B) certify that no action subsequent to component part testing, for example, in the process of final assembly of the consumer product, changed or degraded the consumer product such that it adversely affected the product's ability to comply with all applicable rules, bans, standards, and regulations.

(h) *Recordkeeping requirements.* All testing parties must maintain the documentation required in paragraph (f) for 3 years. Additionally, all certifiers must maintain records to support the traceability of component part suppliers for as long as the product is being distributed in commerce plus 3 years. Test records must be maintained for 3 years. All records must be available in the English language.

**Subpart B - Conditions and Requirements for Specific Consumer Products,
Component Parts, and Chemicals**

§ 1109.11 Component Part Testing for Paint and Other Surface Coatings.

(a) *Generally.* The Commission will permit certification of a product as being in compliance with the lead paint limit of part 1303 of this chapter or the content limits for paint on toys of section 4.3.5.2 of ASTM F 963 if, for each paint used on the product, the party that certifies the product either has obtained a test report or holds a paint certificate as described below and the following requirements are met:

(1) All testing must be performed on dry paint that is scraped off of a substrate for testing;

(2) The tested paint is identical in all material respects to that used in production of the consumer product. The paint samples to be tested must have the same composition as the paint used on the final product. However, a larger quantity of the paint may be tested than is used on the consumer product, in order to generate a sufficient sample size. The paint may be supplied to the testing laboratory either in liquid form or in the form of a dried film of the paint on any suitable substrate;

(3) Documentation required by a testing party pursuant to § 1109.5(f) and the certificate of compliance required of certifiers under section 14(a) of the CPSA and 1109.5(g) identifies each paint tested by color, location, specification number or other characteristic, the manufacturer of the paint, and the supplier of the paint (if different);
and

(4) The substrate used need not be of the same material as in the finished product or have the same shape or other characteristics as the part of the finished product to which the paint will be applied.

(b) *Test reports.* As part of its basis for certifying a children's product to the lead in paint limit, or other paint limit, a domestic manufacturer or importer may rely on a test report showing passing test results for one or more paints used on the product, based on testing either of them has commissioned from a recognized third party conformity assessment body. The manufacturer of the children's product should ensure that each paint sample sent to a third party conformity assessment body is identical in all material respects to that used on the final product. Test reports should identify each paint tested by color, specification number, or other characteristic, as well as the manufacturer of the paint and the supplier of the paint (if different).

(c) *Paint certificates.* (1) Children's products. As part of its basis for certification of a children's product to the lead in paint limit or other paint limit, a domestic manufacturer or importer may rely on a certificate from another person certifying that paint complies with the lead limit. The paint certificate must be based on testing of a representative sample of one or more paints conducted by a third party conformity assessment body. The paint certificate should identify all test reports underlying the certification.

(2) *Products that are not children's products.* For consumer products that are not children's products but are subject to paint limits (such as certain furniture items), a certifier may base its certification on its own testing of each paint used on the product, on

testing by any third party conformity assessment body, on paint certification(s) from any person, or on a combination of these methods.

(3) *Traceability.* Any person who certifies a product as complying with the lead paint limit, or other paint limit, should be able to trace each batch of paint that is used on the product to the paint manufacturer.

(4) *Contamination subsequent to testing.* The product manufacturer should ensure that paint meeting the applicable limits when tested and certified is not later contaminated with lead from other sources before or during application to the product.

§ 1109.12 Component Part Testing for Lead Content of Children's Products

(a) *Generally.* A certifier may rely on component part testing of each accessible component part of a children's product for lead content, where such component part testing is performed by a third party conformity assessment body, provided that:

(1) The determination of which, if any, parts are inaccessible pursuant to section 101(b)(2) of the CPSIA is based on an evaluation of the final product; and

(2) For each accessible component part of the product, the certifier either has a component part test report or a component part certificate.

(b) *Component part test reports.* As part of its basis for certification of a children's product to the lead content limit, a certifier may rely on a test report showing passing test results for one or more component parts used on the product, based on testing by a recognized third party conformity assessment body. Component part test reports should identify each component part tested, by part number or other specification, and the manufacturer and the supplier of the component part (if different).

(c) *Component part certificates.* As part of its basis for certifying that a children's product complies with the applicable lead content limit, a certifier may rely on a certificate from another person certifying that a component part complies with the lead limit. The component part certificate should be based on testing of a representative sample of the component parts by a CPSC-recognized third party conformity assessment body. The certificate pertaining to the component part should identify all test reports underlying the certification consistent with section 14 of the CPSA.

(d) *Certificates for the finished product.* The certificate accompanying the children's product must list each component part that was tested, by part number or other specification, and, for each such component part, identify the corresponding test report or part or component part certificate on which a certification for the finished children's product is based.

§ 1109.13 Component Part Testing for Phthalates in Children's Toys and Child Care Articles

(a) *Generally.* A certifier may rely on component part testing of appropriate component parts of a children's toy or child care article for phthalate content if the certifier is provided with a copy of the original test results obtained from the third party conformity assessment body.

(b) *Component part test reports.* As part of its basis for certification of a children's product to the phthalate content limit, a certifier may rely on a test report showing passing test results for one or more component parts used on the product, based on testing by a recognized third party conformity assessment body. Component part test

reports should identify each component part tested, by part number or other specification, and the manufacturer and the supplier of the component part (if different).

(c) *Component part certificates.* As part of its basis for certification of a children's product to the phthalate content limit, a certifier may rely on a certificate from another person certifying that a component part complies with the limit. The component part certificate should be based on testing of a representative sample of the component parts by a CPSC-recognized third party conformity assessment body. The component part certificate should identify all test reports underlying the certification consistent with section 14 of the CPSA. Any person who certifies a children's product as complying with the phthalate content limits should be able to trace each component part of the product to the component part's manufacturer.

(d) *Certificates for the finished product.* The certificate accompanying the children's product should list each component part required to be tested by part number or other specification and, for each such part, should identify the corresponding test report from a third party conformity assessment body on which the product's certification is based.

§ 1109.14 Composite Part Testing

(a) *Paint and other surface coatings.* In testing paint for compliance with chemical content limits, testing parties may test a combination of different paint samples so long as they follow procedures ensuring that no failure to comply with the lead limits will go undetected (see paragraph (c) of this section). Testing and certification of composite paints shall comply with § 1109.11.

(b) *Component parts.* Third party conformity assessment bodies may test a combination of component parts so long as they follow procedures ensuring that no failure to comply with the content limits will go undetected (see paragraph (c) of this section). Testing and certification of composite component parts for lead content must comply with § 1109.12. Testing and certification of composite component parts for phthalate content must comply with § 1109.13.

(c) *How to evaluate composite part testing.* When using composite part testing, only the total amount or percentage of the target chemical is determined, not how much was in each individual paint or component part. Therefore, to determine that each paint or component part is within the applicable limit, the entire amount of the target chemical in the composite is attributed to each paint or component part. If this methodology yields an amount of the target chemical that exceeds the limit applicable to any paint or component part in the composite sample, additional testing would be required to determine which of the paints or component parts fail to meet the applicable limit.

Office of Hazard Identification and Reduction

SUBJECT : Conditions and Requirements for Testing Component Parts of
Consumer Products

I. Introduction

Sections 14(a)(1) and (2) of the Consumer Product Safety Act ("CPSA" or "Act"), as amended by section 102(a)(2) of the Consumer Product Safety Improvement Act of 2008 ("CPSIA"), Public Law 110-314, require the issuance of certificates for non-children's products subject to a consumer product safety rule under the CPSA or similar rule, ban, standard, or regulation under any other Act enforced by the Commission and for children's products subject to a children's product safety rule (hereafter referred to as applicable rules for non-children's products and children's product safety rules for children's products).

More specifically, section 14(a)(1) of the CPSA requires that every manufacturer and private labeler of a consumer product subject to an applicable rule must issue a general conformity certification based on a test of each item or a "reasonable testing

UNDER CPSA 6(b)(1)

THIS DOCUMENT HAS NOT BEEN
REVIEWED OR ACCEPTED BY THE
COMMISSION.

program.” With regard to “children’s products” (as that term is defined in the CPSIA), section 14(a)(2) of the CPSA specifies that certification must be based on third party testing by a CPSC-recognized third party conformity assessment body if that product is subject to a children’s product safety rule. Moreover, the testing is required to be conducted on “sufficient samples,” “that are identical in all material respects” to the children’s product being distributed. Based on this third party testing, the manufacturer and private labeler must issue a children’s product certificate that lists all applicable children’s product safety rules before importing for consumption or warehousing or distributing such products in commerce.

Manufacturers have asked the CPSC whether they may: (1) issue certificates for products based on testing conducted or arranged by component part suppliers; (2) issue certificates for products based on testing of component parts, versus testing the finished product; and (3) aggregate separate component parts to create a sample for testing (composite or subassembly testing). These alternatives would result in advantages for component part suppliers and manufacturers (including importers).

If manufacturers could issue either general conformity or children’s product certificates based at least in part on testing performed by or arranged by component part suppliers, the manufacturers would not have to redundantly test the products, or contract to have the products tested, themselves. Suppliers who chose to perform or arrange the required testing could reduce the total amount of testing required by section 14(a) of the CPSA, since the same component part might be used in a number of different products. For example, a firm might supply plastic for making dolls to more than one manufacturer. If the manufacturers could not rely on test results from the supplier, each manufacturer would have to obtain their own CPSC-recognized third party conformity assessment body test results. Likewise, if a manufacturer used the same plastic in five different dolls, the manufacturer who could rely on testing performed by the supplier would not have to test the plastic for each of the five dolls; instead, the manufacturer could apply the testing results to all five dolls.

Testing only the relevant component parts rather than the finished product can avoid the sometimes difficult process of preparing a finished product for testing and can reduce the number of finished products that may have to be destroyed in destructive testing. Allowing similar component parts to be combined to make one sample for testing also can reduce the number of tests required without reducing any requirements for compliance to the applicable rules or children's product safety rules.

The suitability of testing component parts of products rather than the finished products relates to the Commission's requirements that limit the allowable amount of particular chemicals in products, namely the lead content limits for children's products in section 101 of the CPSIA, the phthalate content limits for children's toys and child care articles in section 108 of the CPSIA, the lead in paint limits in 16 C.F.R. part 1303, and the limitations of the amounts of compounds of antimony, arsenic, barium, cadmium, chromium, lead, mercury, or selenium in paints or other surface coatings in toys in section 4.3.5.2 of ASTM F 963 (which section 106(a) of the CPSIA states are to be considered consumer product safety standards issued by the Commission under section 9 of the CPSA). For other types of requirements, testing an entire product generally is required.

Thus, a certifying party issuing a general conformity certificate or a children's product certificate should identify all the applicable rules or children's product safety rules that apply to their product and demonstrate, with either component part or finished product testing, or both, that the product complies with the rules. Uncertainties as to whether component part testing is appropriate for determining compliance should be resolved in favor of finished product testing.

The Commission has issued several documents already regarding component part testing: (1) *Statement of Policy: Testing of Component Parts with respect to Section 108 of the Consumer Product Safety Improvement Act*, available on the CPSC website at <http://www.cpsc.gov/about/cpsia/componenttestingpolicy.pdf>, which outlined the Commission's interim position on component testing of products containing plasticized

component parts for phthalates; (2) *Statement of Policy: Testing and Certification of Lead Content in Children's Products*, available on the CPSC website at <http://www.cpsc.gov/about/cpsia/leadpolicy.pdf>; (3) *Guidance Document: Testing and Certification Requirements Under the Consumer Product Safety Improvement Act of 2008*, available at <http://www.cpsc.gov/library/foia/foia10/brief/102testing.pdf>; (4) a notice regarding a Commission workshop on testing and certification published in the FEDERAL REGISTER on November 13, 2009, at 74 FR 58611, 58616; and (5) *Interim Enforcement Policy on Component Testing and Certification of Children's Products and Other Consumer Products to the August 14, 2000 Lead Limits (the Lead Limits Interim Enforcement Policy)*, available at <http://www.cpsc.gov/businfo/frnotices/fr10/comppol.pdf> and published in the FEDERAL REGISTER on December 29, 2009 (74 FR 68593). The proposed rule also reflects the Commission's consideration of comments to those notices and to the workshop.

II. Component Part Testing

A component part would be defined as any part of a consumer product, including a children's product, that either must or may be tested separately from a finished consumer product, to assess the consumer product's ability to comply with a specific rule, ban, standard, or regulation enforced by the CPSC. For some applicable rules or children's product safety rules, the remainder of the finished product is not required to determine whether a component complies. This is most easily understood in the context of chemical contents requirements. Section 101 of the CPSIA sets maximum limits on the lead content of accessible component parts on children's products. Once a determination has been made that a component part to a children's product is accessible (such as a plastic button on a cotton doll's dress – cotton being excluded from testing for lead), only a test regarding the button is needed to assess lead content. Thus, lead content testing on button samples can establish compliance with the lead content rule for children's products without the remainder of the doll. However, for some rules, component part testing will generally not be acceptable. For example, crib tests require the entire crib. In most cases, small parts testing, under existing CPSC regulations, will require the finished product to assess compliance.

Similarly, for some non-children's products, component part testing can be used to assess compliance. Bicycle handlebar tests do not require an entire bicycle to test for compliance with the applicable rules. Compliance of the handlebar "component" is determined separately. As for children's products, some non-children's product tests require the finished product. For example, some tests for walk-behind power lawn mowers, such as the obstruction test, require testing of the finished product.

If a component part test is to be considered valid for purposes of certifying a product, the component part as tested must be the same in all material respects as the component on the finished product. "In all material respects" means that for the purposes of complying with a requirement, the component part as tested and the component part on the finished product exhibit the same behavior. For example, if the paint used for a doll's eyes is to be tested for compliance to the lead in paint requirement, paint from the same container painted on a large piece of glass (and therefore easy to scrape off for testing) would be a "component part" identical in all material respects to the paint on the finished doll. Further, the party issuing the general conformity certificate or children's product certificate must assure that the component part is not subject to contamination or degradation that would affect compliance before or during assembly onto the finished product.

Some chemical tests may be performed on the raw materials used in the component part, rather than on the finished component part. For example, lead content testing may be performed on the plastic resins before they are used to create molded component parts. Due care must be taken to prevent contamination or degradation of the materials after testing. Similarly, component parts may be used to evaluate compliance only if due care is taken to prevent any contamination or degradation that could affect compliance.

Additionally, component part testing should be allowed only if final assembly into the finished product does not cause the component part to become noncompliant to any

applicable rule or children's product safety rule. For example, if the assembly of a component part (consisting of several component parts itself) containing inaccessible lead caused the lead to become accessible (e.g., removing a protective coating over lead-bearing components), the finished product no longer complies with section 101 of the CPSIA, and component part testing is not allowed. The component part with the removed coating is no longer the same in all material respects to the tested component part.

Parties issuing general conformity or children's product certificates may not rely on component part testing conducted by another testing party unless the component parts are traceable. Traceability is the ability of a party issuing a general conformity or children's product certificate to identify the source of a component part, including the name and address of the entity providing the component part to them. A party supplying component test data to a party issuing a general conformity or children's product certificate should provide the following information:

- (1) identification or a description of the component part tested;
- (2) identification of a lot or batch number for which the testing applies;
- (3) identification of the applicable rules, bans, standards, and regulations for which each component part was tested;
- (4) identification or a description of the testing methods and sampling protocols used;
- (5) the date or date range when the component part was tested;
- (6) the results of each test on a component part; and
- (7) if the product was tested by a third party conformity assessment body, regardless of whether it was required because the product is a children's product or whether the testing party chose to use such third party laboratory, identification of such testing laboratory, a copy of the original test results, and a certification that all testing was performed in compliance with section 14 of the CPSA.

The above information is needed so that, if noncomplying products are found, the Commission can use this information to determine whether a party issuing a general conformity or children's product certificate or a conformity assessment body is not complying with the appropriate requirements.

Testing parties should maintain the documentation listed in (1) through (7) above for 3 years. Additionally, parties issuing a general conformity or children's product certificate should maintain records to support the traceability of component part suppliers for as long as the product is distributed in commerce plus 3 years. The purpose of documentation being kept for 3 years is to ensure that the products have time to clear the distribution channels and get into consumer use. If there is a compliance problem in a product, 3 years should be sufficient to uncover any problems with the product. Commission staff would have time to obtain the records to review the firm's reasonable testing program and take any necessary enforcement action during this 3-year period.

III. Specific Requirements for Lead and Phthalates

1. Lead in Paint

Section 101(f)(1) of the CPSIA required the Commission to revise its preexisting regulation (at 16 CFR 1303.1) so that paints and similar surface coating materials having a lead content in excess of 90 parts-per-million (ppm) of the weight of the total nonvolatile content of the paint or the weight of the dried paint film are banned hazardous products. (as used here, "paint" means broadly any type of surface coating that is subject to 16 CFR part 1303 or section 4.3.5.2 of ASTM F963.) The new lower limit in 16 CFR part 1303 applies not only to paint sold to consumers as such (for example, a gallon of paint sold at a hardware store), but also to any paint on toys or other articles for children and to any paint on certain household furniture items (not limited to children's furniture). See 16 CFR part 1303. The principles for testing paint subject to 16 CFR part 1303 also apply to the testing of paint and surface coatings for toys in section 4.3.5.2 of ASTM F963.

Because compliance of a paint to its content limits is a function of the paint and not of the component part or substrate to which it is applied, component part testing of paint allows testing of paint after it has been applied to any suitable substrate, in an appropriate quantity, and dried.

For the tested paint to be identical in all material respects to that used in production of the consumer product, the paint samples tested must have the same composition as the paint used on the final product. For example, if a children's product manufacturer uses a drying agent that mixes with the paint, then the test sample should reflect this mixture. However, a larger quantity of the paint may be tested than is used on the consumer product, in order to generate a sufficient sample size for testing. For example, a children's product manufacturer may apply paint to a large surface area of a substrate with the paint product for the purposes of generating a sufficient amount of paint for the sample. The paint may be supplied to the third party conformity assessment body either in liquid form or in the form of a dried film of the paint on any suitable substrate. However, testing should be performed on dried samples only.

The testing party and the party issuing the general conformity or children's product certificate should maintain documentation identifying each paint tested by color, location, specification number or other characteristic, the manufacturer of the paint, and the supplier of the paint (if different from the manufacturer).

The substrate to which the paint is applied for testing purposes does not need to be made of the same material as in the finished product, nor does it have to have the same shape or other characteristics as the part of the finished product to which the paint will be applied.

A party issuing a children's product certificate, as part of its basis for certification of a children's product to the lead paint limit or other paint limit, may rely on a test report from another person showing passing test results for one or more paints (all tests must

show passing results) used on the product, based on testing by a CPSC-recognized third party conformity assessment body. The party certifying the children's product should ensure that each paint sample sent to a CPSC-recognized third party conformity assessment body is representative of that used on the finished product. Test reports should identify each paint tested, by color, specification number, or other characteristic, and identify the manufacturer of the paint and the supplier of the paint (if different).

As part of its basis for certification of a children's product to the lead paint limit or other paint limit, a party issuing a children's product certificate may alternatively rely on a certificate from another person certifying that paint complies with the lead limit. The paint certificate must be based on testing by a CPSC-recognized third party conformity assessment body of samples of paints that are identical in all material respects to the paints used on the finished product. The paint certificate should identify all test reports underlying the certification. The party issuing a children's product certificate should be able to trace each batch of paint that is used on the product to the paint manufacturer. Due care should be taken by the party issuing a children's product certificate to ensure that paints meeting the applicable limits are not later contaminated with lead from other sources before or during application to the product.

For consumer products that are not children's products, but are subject to lead paint limits (such as certain furniture items), a party issuing a general conformity certificate may base its certification to the lead paint limit on its own testing of each paint used on the product, on testing by any third party conformity assessment body, on paint certification(s) from any person, or on a combination of these methods. However, parties issuing a general conformity certificate should ensure that paint meeting the applicable limits when tested and certified is not later contaminated with lead from other sources before or during application to the product.

2. Lead Content

On August 14, 2009, the general limit for lead in any accessible part of a children's product was reduced from 600 ppm to 300 ppm. The lead content limit for

children's products will be lowered to 100 ppm beginning August 14, 2011, unless the Commission finds that a limit of 100 ppm is not technologically feasible for a product or product category.

In general, lead content requirements for children's products apply to any accessible part of the product. Neither paint nor electroplating may be considered as making underlying materials inaccessible. The certification must be based on testing by a CPSC-recognized third party conformity assessment body listed on CPSC's website as qualified to test for lead content (see www.cpsc.gov/cgi-bin/labapplist.aspx). If the product bears paint, it must also be certified as in compliance with the 90 ppm limit. The Commission has determined that some materials, by their nature, will never exceed the lead content limits. These include many natural materials such as gemstones, wood, cotton, and wool, as well as certain refined metals and alloys. For a more complete list of such materials, see 74 FR 43031 (August 26, 2009) (to be codified at 16 CFR 1500.91). If all accessible parts of a children's product consist of such materials, then that product does not need be tested or certified as in compliance with the lead content limits.

A party issuing a children's product certificate may rely on component part testing of each accessible part of a children's product provided that:

1. the determination of which, if any, parts are inaccessible pursuant to section 101(b)(2) of the CPSIA is based on an evaluation of the finished product; and
2. for each accessible component part of the product, the certifier either has a component part test report or a component part certificate.

A party issuing a children's product certificate, as part of its basis for certification of a children's product to the lead content limit, may rely on a test report showing passing test results for one or more component parts (all tests must show passing results) used on the product, based on testing by a CPSC-recognized third party conformity assessment body. The test reports should identify each component part

tested, by part number or other specification, as well as the manufacturer of the component part and the supplier (if different). Alternatively, a party issuing a children's product certificate, as part of its basis for certification of a children's product to the lead content limit, may rely on a certificate from another person certifying that a component part complies with the lead limit. The component part certificate should be based on testing of a representative sample of the component part(s) by a CPSC-recognized third party conformity assessment body. The component part certificate should identify all test reports underlying the certification consistent with section 14 of the CPSA.

The children's product certificate accompanying the children's product should list each component part tested, by part number or other specification, and for each such part, identify the corresponding test report or component part certificate on which product certification is based.

3. Phthalates

Section 108 of the CPSIA permanently prohibits the sale of any children's toy or child care article containing concentrations of more than 1000 ppm of three specified phthalates. Section 108 of the CPSIA also prohibits, on an interim basis, the sale of any children's toy that can be placed in a child's mouth or child care article containing concentrations of more than 1000 ppm of three additional phthalates, pending the recommendation of a Chronic Hazard Advisory Panel. In general, phthalates are chemicals added to plastic to make the plastic more flexible or resilient. Testing the phthalate content of an entire children's toy or child care article may present certain difficulties. For example, the risk presented by phthalates in a component part may not be adequately described if the percentage concentration of phthalates is determined in comparison to the whole product, which may have other component parts that do not contain phthalates. In an extreme example, a product that has a plasticized component part that had a phthalate concentration above 1000 ppm arguably could be brought into compliance with the phthalate limit by adding more non-plasticized material and thus "dilute" the concentration of phthalates in the whole product. Testing only the plasticized component parts would avoid such "dilution" scenarios, is more protective of

human health, and is consistent with the CPSIA's goal of limiting children's exposure to phthalates. Component part testing may also significantly reduce the testing costs for manufacturers in most circumstances.

A party issuing a children's product certificate may rely on component part testing of appropriate component parts of a children's toy or child care article for phthalate content if it is provided with a copy of the original test results obtained from the CPSC-recognized third party conformity assessment body showing passing results.

As part of its basis for certification of a children's product to the phthalate content limit, a party issuing a children's product certificate may rely on a test report showing passing test results for one or more component parts used on the product, based on testing by a CPSC-recognized third party conformity assessment body. Component part test reports should identify each component part tested, by part number or other specification, and the manufacturer and the supplier of the component part (if different).

Alternatively, as part of its basis for certification of a children's product to the phthalate content limit, a party issuing a children's product certificate may rely on a certificate from another person certifying that a component part complies with the phthalate contents limit. The component part certificate would have to be based on testing of a representative sample of the component part(s) by a CPSC-recognized third party conformity assessment body. The component part certificate should identify all test reports underlying the certification required by section 14 of the CPSA. Any person who certifies a children's product as complying with the phthalate content limits should be able to trace each component part of the product to the component part's manufacturer.

The certificate accompanying the children's toy should list each component part tested by part number or other specification and, for each such part, should identify the corresponding test report or component part certificate on which product certification is based.

4. Composite Testing

Composite testing is where more than one paint or surface coating, or more than one component part, are combined and the combination is tested for the level of the target chemical. This method can reduce the number of tests required or the number of products needed to obtain a sample large enough to test. For example, if different parts of a doll are painted with small amounts of different paints, the paints could be mixed together and tested for lead.

In testing paints for compliance with chemical content limits, testing parties may test a combination of different paint samples so long as they follow procedures ensuring that no failure to comply with the lead limits will go undetected. For an example of an acceptable method, see Test Method CPSC-CH-E1003-09, *Standard Operating Procedure for Determining Lead (Pb) in Paint and Other Similar Surface Coatings* (April 26, 2009) (available on the Internet at <http://www.cpsc.gov/about/cpsia/CPSC-CH-E1003-09.pdf>). The testing and certification of composite paints should comply with the provisions for lead in paint testing.

A testing party may use a CPSC-recognized third party conformity assessment body to test a combination of plastic component parts or a combination of metal components so long as the third party conformity assessment body follows procedures ensuring that no failure to comply with the lead limits will go undetected. The testing and certification of composites of component parts should comply with the provisions for the lead content of children's products or the phthalate content of toys and child care articles.

When using composite testing, only the total amount of the target chemical is determined, not how much was in each individual paint or component part. Therefore, to determine that each paint or component part is within the applicable limit, the entire amount of the target chemical in the composite should be attributed to each paint or component part. If this method yields an amount of the target chemical that exceeds

the limit applicable to any paint or component part in the composite sample, additional testing would be required to determine which of the paints or component parts (if any) fails to meet the applicable limit.
