SUBJECT: Effect of Novel Coronavirus Pandemic on 2020 NEISS Estimates (March–December, 2020)

**Summary**

This report compares results from the National Electronic Injury Surveillance System (NEISS) from March through December 2019 with the same period in 2020. The March through December 2020 time period approximates the first 10 months of the novel coronavirus pandemic in the United States.

Comparing these two periods reveals a 22 percent overall reduction in consumer product-related injuries<sup>1</sup> treated in hospital emergency departments in 2020. The largest decrease occurred in

---

<sup>1</sup> For this analysis, similar product codes were grouped into broader product categories. Appendix A provides an overview of NEISS product categories. Details on specific product codes appear in the NEISS Coding Manual, at <https://www.cpsc.gov/s3fs-public/2020-CPSC-Only-Non-Trauma-Coding-Manual.pdf>? For more information on product groups and subgroups, please see the NEISS Estimates Query Builder at <https://www.cpsc.gov/cgi-bin/NEISSQuery/home.aspx>.

April 2020 (45 percent lower than April 2019). From June to December 2020, the decrease in reported injuries for each month compared to the same month in 2019 ranged from 14 percent to 19 percent, perhaps as a result of some states going to less-restrictive or loosening shelter-in-place and social-distancing orders.

## **Social Context**

The NEISS data from March through December 2020 showed significant changes in some categories of product-related injuries treated in hospital emergency departments (EDs). The CPSC Statistical Support Branch, Division of Hazard and Injury Data Systems, observed changes in the nature and volume of injuries treated. These changes correlate with public health measures to combat the spread of COVID-19 throughout the United States.

In March 2020, acting on guidance from the U.S. Centers for Disease Control and Prevention and the National Institutes of Health, state and local governments issued a variety of orders with significant impacts on social behavior. State and local public health orders restricted gathering and movement and imposed masking and social distancing requirements. Many schools and employers transitioned to remote learning and working. Broad classes of businesses and public facilities, such as gyms, pools, and other high-density recreational facilities, were restricted or closed. Many school and community-based organized sports and recreation programs reduced or suspended operation. Service, hospitality, sports, and entertainment industries were similarly restricted or closed. The extent and duration of these changes varied from community to community. Displacement from gyms and entertainment coincided with increased home and outdoor-focused activities, including use of home exercise equipment, home improvements, and outdoor recreational activities.

In response to the COVID-19 pandemic, health care systems adjusted their operations to combat a highly infectious airborne pathogen. Some hospitals surged intensive care unit and emergency department capacity and shifted medical staff from various disciplines to meet the increasing COVID-19 patient load. In addition, hospitals restricted access to their facilities to prevent unnecessary spread of the virus. Emergency departments, which are the reporting entities for NEISS data, experienced periodic surges that required triage of patients. Patients with less severe injuries were likely seen in other settings, such as physician offices, urgent care, and convenience care centers. Media reported that members of the public avoided seeking care at hospitals for fear of exposure to COVID-19. Hospitals suspended or cancelled treatment of non-life-threatening conditions and elective surgeries.<sup>2,3</sup>

## **The National Electronic Injury Surveillance System**

The NEISS, a statistical sample of 96 hospitals, collects data from emergency departments about injuries associated with the use of consumer products. NEISS is based on a nationally representative probability sample of hospitals in the United States and its territories. The current NEISS sample consists of five strata: four representing hospital emergency departments of differing sizes and a fifth representing emergency departments from children's hospitals.

Each participating NEISS hospital reports patient information for every emergency-department visit associated with a consumer product or a poisoning to a child younger than 5 years of age. The total number of product-related hospital emergency department visits nationwide can be estimated from the sample of cases reported in the NEISS. The number of hospitals actively reporting data to the NEISS varies by month and year.

## **Broad Observations**

The 2020 NEISS data showed an overall reduction in product-related injuries of 22 percent. However, the incidence of more severe injuries requiring hospitalization was stable, indicating that less severe injuries accounted for the overall reduction in ED-treated injuries. The NEISS data do not include product-related injuries treated by care providers other than the emergency department, such as urgent care centers and physician's offices. Furthermore, the NEISS data do not capture most fatalities, which may occur before arrival at the emergency department or after patients are admitted to the hospital. For other sources of publicly available data, including reports from medical examiners and coroners, death certificates, news clips, and in-depth investigations, please visit: <https://cpsc.gov/Research--Statistics/Clearinghouse-Online-Query-Tool>. Note, however, that death certificate data for 2019 and 2020 are incomplete because there may be a lag of up to 2-3 years in receiving death certificate data from some states.

Examination of changes in the NEISS data in the context of the COVID-19 pandemic may offer new insights into injuries related to specific product categories. The apparent avoidance of hospital emergency departments may make drawing conclusions from the NEISS data problematic. Because the NEISS does not include self-treatment, doctors' offices, or urgent care centers, the data cannot accurately account for whether those sites experienced offsetting increases in product-related injuries.

## **Decreases in Reported Injuries**

The largest decreases in injuries were sports-related injuries. Injuries associated with track and field, lacrosse, soccer, volleyball, hockey, baseball, softball, football, and basketball all saw reductions of more than 60 percent in the 2020 period compared to 2019. This reduction in sports-related injuries was strongest in the youth to late teen ages. This decrease is likely attributed to the suspension of school and youth sports leagues in 2020 in response to the pandemic.

The reductions in emergency department visits, however, were not uniform across the range of injury severities in the 2020 period. Severe injuries requiring hospitalization remained relatively stable, while injuries that were treated and released (indicative of being less severe) decreased 25 percent. Visits for relatively minor injuries, such as strains and sprains, decreased 38 percent during the 2020 period, while visits for more severe injuries saw smaller decreases (fractures - 10 percent decrease). These variations lend support to the theory that hospital emergency department visits may have decreased, particularly for less severe injuries, rather than the occurrence of injuries decreasing.

## **Increases in Reported Injuries**

Although there was an overall decrease in hospital-treated injuries during this period, significant increases in emergency-department visits occurred for injuries involving fireworks, protection devices, water skiing/tubing/surfing, power saws, and all-terrain vehicles. Of these, the greatest overall increase in injuries was related to fireworks, with an increase of 57 percent.

From March to December 2020, staff also observed an estimated 5,065 mask-related injuries treated in hospital emergency departments. Forty two percent of these injuries occurred in August and September 2020, which accounts for only 20 percent of the period. Staff did not observe any reported mask-related injuries in the 2019 period. The majority of these injuries were the result of skin irritations (*e.g.*, contusions, abrasions, dermatitis). Staff also found smaller numbers of mask-related injuries resulting from wearers being distracted while putting on, adjusting, or reaching for a mask; experiencing shortness of breath while wearing a mask; having obscured vision while wearing a mask; and having fogged eyeglasses.

## **Key Findings**

Staff categorizes the NEISS data variously, looking at very large, broad categories, such as overall product groupings, age groups, injury diagnosis, ED disposition, and more. With more than 800 active NEISS product codes, analyzing data at the level of individual product codes is not practical for this memorandum. Instead, staff grouped similar products and summarized the incidents involving the similar products. The NEISS data can also be split into smaller and cross-sectional subgroups to look for areas of significant increases and decreases that might be hidden in the larger groupings.

The tables below show some of the largest decreases and increases in estimated product-related injuries treated in emergency departments, comparing the March to December 2019 and 2020 periods, along with an indicator of statistical significance.<sup>4</sup>

---

<sup>4</sup> Consistent with how NEISS estimates are displayed with the online query system, estimates below 1,200 are not listed.

**Table 1: Estimated Consumer Product-Related Emergency Department Visits  
By Month, March 1-December 31, 2020**

Month	2019 Estimate	2020 Estimate	Percent Change	Statistically Significant	p-value
March	1,098,432	820,699	-25%	Yes	0.00

70 or older	Fishing	3,889	4,551	17%		0.33
70 or older	Horseback Riding	1,796	2,065	15%		0.33

Finally, staff looked at trends for several products of focus at CPSC, to evaluate potential changes. Given the likely avoidance of hospital emergency departments during this period, these are for the more serious injuries only (hospitalized/transferred/held). However, it should be noted that these represent changes in emergency department treated injuries, and do not reflect the fatalities that are significant drivers for CPSC interest in these products.

**Table 15: Trends in Hospitalized/Transferred/Held Estimated Injuries for CPSC Focus Product Groups  
March 1-December 31, 2020**

Product Group	2019 Estimate	2020 Estimate	Percent Change	Statistically Significant	p-value
All Nursery Equipment	2,332	2,185	-6%		0.39
All Scooter, Skateboards, Hoverboards	10,893	15,171	39%	Yes	0.03
ATVs, Mopeds, Minibikes, etc.	28,141	37,119	32%	Yes	0.00
Batteries, All Types	1,979	1,948	-2%		0.40
Cleaning Agents (Exc. Soaps)	1,775	3,046	72%		0.10
Cleaning Equip, Non-Caustic /Detergent	3,611	4,135	15%		0.26
Drug Poisonings to Children Under 5	7,732	6,965	-10%		0.22
Miscellaneous Toys	4,000	4,396	10%		0.34
Sills or Frames of Windows or Doors	6,938	6,723	-3%		0.39
Swimming Activity, Pools, Equipment	10,578	9,740	-8%		0.32
Trampolines	4,786	5,076	6%		0.37

## Appendix A: Product Categories

Details on specific product codes appear in the NEISS Coding Manual, at: <https://www.cpsc.gov/s3fs-public/2020-CPSC-Only-Non-Trauma-Coding-Manual.pdf>? For more information on product groups and subgroups, please see the NEISS Estimates Query Builder at: <https://www.cpsc.gov/cgibin/NEISSQuery/home.aspx>.

<b>Product Category</b>
Air Conditioners
Alarms & Escape Equip
All Nursery Equipment
All Toys
Amusement Attractions (Incl. Rides)
Archery
ATVs, Mopeds, Minibikes, etc.
Auto Tools, Accessories, Chemicals
Automatic Doors, Openers
Baby Carriages, Walkers, etc.
Barbecue Grills, Stoves, Equipment
Baseball/Softball
Basketball
Bathtub & Shower Structures
Batteries, All Types
Battery Chargers/Adaptors
Beach, Picnic, Camping Equipment
Beds, Mattresses, Pillows
Bicycles & Accessories
Billiards or Pool
Blankets
Bowling
Boxing
Business, Office Machines, Equipment
Cabinets or Door Hardware
Cans, Other Containers
Carpets & Rugs
