

Fast Facts about Fire Safety in Multigenerational Homes

Multigenerational households are becoming more common. This living arrangement allows families of different generations to come together to face many challenges — raising children, caring for aging parents, managing housing costs, single parenting, and more.

- There are about 4.3 million multigenerational households in the United States, according to the U.S. Census Bureau. This represents 5.6 percent of all U.S. households.¹
- 65% of multigenerational homes include the head of household with a child and grandchild.
- 34% of multigenerational households include the head of household with a parent and child.

Fires²:

- There are about 360,000 home fires every year leading to roughly 2,500 deaths.
- In addition, nearly 13,000 fire injuries are reported each year.
- Seven people die in home fires every day.
- The National Fire Protection Association (NFPA) estimates that three of every five home fire deaths result from fires in homes with no smoke alarms or no working smoke alarms.
- Smoke alarms should be replaced after 10 years. They don't last forever.

Falls³:

- Unintentional falls are the leading cause of non-fatal injuries treated in hospital emergency departments for most age groups.
- More than 6 million adults age 25 and older and more than 1.5 million children younger than 10 are treated in hospital emergency departments for unintentional fall injuries.
- Falls are the most common hazard leading to unintentional death for adults 65 and older, accounting for more than 20,000 deaths in a recent year.
- Many fall injuries to adults 65 and older are linked to stairs, ramps, landings or floors.
