## General Comment

My company manufactures decals used to provide permanent decoration on glass and ceramic substrates. We take inorganic metallic oxides, mix them with oils and screenprint these inks onto transfer paper. The images are transferred from the paper onto a glass or ceramic substrate. The substrate is next fired in an oven at temperatures ranging from 1100 to 1500 degrees Fahrenheit. This causes all of the organic materials in the ink to burn off and only leave the inorganic metallic oxides. At this point the ceramic colors are permanently attached to the substrate. Any small amounts of lead that may be present are not free to be released from the substrate as they are vitrified in the firing process.

Most of the decals that we produce use lead free colors (metallic oxides). The majority of our color suppliers are only able to certify the lead content of the colors to a level of <300 ppm.

A lead content level of 100 ppm is impossible for certify, as most of our suppliers do not offer products with lead content levels this low. One of the reasons for this is the amount of background levels of lead found in the environment. To make a cobalt blue color our suppliers take cobalt, which is mined from the earth, and grind it into a powder which we use to make our ink. Metallic oxides mined from the earth have varying and inconsistent concentrations of background levels of lead.

Given the limitations of our vendor's inability to produce products that can be certified to have a

lead content less than 100 ppm, it is not feasible for us to produce a decal that can be used on glass or ceramic products under this Act.

Is the real question the appropriate lead content level of a children's product or the potential amount of lead that can be released from a children's product? Products that are decorated with ceramic decals have very little potential for any lead release.

**CPSC-2010-0080-0003.1:** Comment from Ricardo Ruiz

August 20, 2010

Consumer Product Safety Commission

To whom it may concern:

I am the proud father of two children, one is five and the other one is two years old. My wife and I feel fortunate for having healthy children, we enjoy watching them grow and think about their promising future in a safer, healthier and more just society and world. Besides responsibilities and duties of raising a family, we also have lots of fun together, go places, do activities and play, most of the time with their toys. Like other kids, our children have a significant variety and amount of toys. We know about the presence of lead and other toxic chemicals in toys, reason for which we try to keep alert on safety recalls, and learn and understand as much as we can about the materials the toys are made with, so we can provide our children healthy and harmless toys.

As Consumers Union (2007) states, children should not be exposed to lead from products intended for their use and they support legislative efforts to ban lead, above minute amounts, in any product intended for use by children. Although significant progress have been made to control and reduce the presence of lead in children's products, according to HealthyStuff.org (n.d.), a test done in 2009 on nearly 700 toys and children's products, conducted by the Ecology Center and their non-profit citizen advocacy and environmental health partner organizations, concluded that lead is still found in a significant percentage of children's toys; lead was detected in 18% (119) of the 669 products tested. I think it is also important to mention that, per HealthyStuff.org (n.d.), in 2007, the American Academy of Pediatrics (AAP) recommended a level of 40 parts per million (ppm) of lead as the maximum that should be allowed in children's products; lead was detected at greater than 40 ppm in 7% (44) of the 669 products tested. Therefore, we learned with joy about this proposed regulation requiring manufacturers of children's products to test and certify their products to contain no more than 100 ppm by 2011, if determined to be technologically feasible. In this regard, it is my understanding that safe toys are possible, as "two-thirds (68%) of the products tested in 2009 did not contain any lead, cadmium, arsenic, mercury or PVC, including many made in China. These results show that manufacturers can make toys free of unnecessary toxic chemicals" (HealthyStuff.org, n.d.).

Said this, my wife and I strongly support this regulation, and any future efforts and improvements, and look forward to celebrating its approval, on behalf of our children and future generations, to whom we have the responsibility to inherit a safer and healthier environment, a more just and fair society, simply a better world.

Sincerely,

Ricardo Ruiz

## General Comment

We are selling metal trims used for many famous apparel brands in U.S. As for the standard of lead in substrate- 100ppm, starting from 2011 Aug, we think that the standard is too strict to follow. Since recycled materials are used to produce brass which is common to be used for making metal buttons, it may contain lead over 100ppm. According to our brass material supplier's inhouse and 3rd party test report, it is far below 100ppm, but it may be difficult to comply with it 100% by any possibility. The master coil of brass is several tons, there will be no way to test 100%. Also even we do not use recycled materials, it may contained Lead as natural substance.

**CPSC-2010-0080-0005.1:** Comment from Anne Lardner

**Request for Comments and Information  
Consumer Product Safety Improvement Act (CPSIA)  
Technological Feasibility of 100ppm for Lead Content  
CPSC Docket No. CPSC-2010-0080**

In response to the Consumer Product Safety Commission's (CPSC) request for comments regarding the technological feasibility of 100ppm for lead content, Promotional Products Association International (PPAI) offers the following observations about the impact on our industry.

PPAI—the promotional products industry's only international not-for-profit trade association—offers education, tradeshows, business products and services, mentoring, technology and legislative support to its more than 7,500 global members. Promotional products are more than a \$15 billion industry and include wearables, writing instruments, calendars, drinkware and many other items, usually imprinted with a company's name, logo or message.

The industry consists of approximately 21,000 distributors and 3,500 suppliers. The distributor develops solutions to marketing challenges through the innovative use of promotional products and is a resource to corporate buyers, marketing professionals and others. A supplier manufactures, imports, converts, imprints or otherwise produces or processes promotional products offered for sale through distributors and the distributors' sales force known as promotional consultants.

The promotional products industry differs in several ways from a traditional manufacturer to retail supply chain, but the most important distinction lies in the process of customizing the products through various forms of decoration (imprinting, embroidery, etching, engraving or embossing). Products in the promotional products industry are either manufactured in the U.S. or imported, decorated and sold by suppliers to or through distributors that have obtained an order for the decorated products from businesses (end buyers) that have their company logos and messages decorated on the products.

The decoration applies a company logo, advertising message or other information to assist the end buyer purchaser in creating brand awareness. Products may be provided to fill a specific order or inventoried by one or more parties until an order is entered into the supply chain from an end buyer to a distributor to a supplier, which may require several months from the time a product is originally manufactured.

Promotional products professionals manufacture, import, decorate and sell hundreds of thousands of different types of products and employ more than 28 different decorating methods. Test results show that while certain types of materials will consistently comply with the proposed lower lead limits, reliable compliance will be a challenge with other types of materials.

For example, product types such as glass, paper, stone and ink contain very low levels of lead and do not present any significant testing challenges. However, many other promotional products are composed of metal or contain metallic components and these materials pose significant testing challenges.

Lead is a naturally occurring element and it is uncommon for metallic materials to get a clean pass, meaning no lead detected, when tested for lead in substrate. While there are some metallic materials that comply with the proposed 100ppm limit, this does not mean that 100ppm is technologically feasible for all metals. There are many different metallic materials (e.g. copper alloy, tin alloy, zinc alloy) and many of these materials will not comply with the proposed lower limits not because of technology, but solely due to the metallic nature of the item itself.

If this proposed limit goes into effect, many components may no longer be able to be used in products on a consistent basis, resulting in redesign, research into alternative materials and even loss of production line options.

Additionally, the recent meeting between The YKK Group and CPSC staff was enlightening in YKK's disclosure that identical tests on identical items performed by multiple conformity assessment bodies resulted in inconsistent findings. According to YKK, only half of the samples tested delivered what YKK deemed to be acceptable results:  $\pm 10$  or 61-81ppm. The test result range was 0ppm to 331ppm for an item known to contain 71ppm lead.

This speaks volumes about the testing challenges posed by these proposed lower limits. Retesting to compliance is not an option. Therefore, it is vitally important that third party test results be both accurate and consistent. If third party assessment bodies cannot reliably and consistently test to lower lead limits, then it is not feasible to lower those limits. It is better to preserve the 300ppm lead limits than allow inaccurate test results to impose economic hardships on business.

While we understand that the scope of this inquiry focuses on the question of technological feasibility, we must ask you to consider the economic impact of the proposed change. What are the tangible benefits associated with lowering the lead content levels from 300 to 100ppm? Do those benefits justify the economic impact of regulating and implementing such a move? The vast majority of promotional products are fairly inexpensive. In some cases the incremental cost of compliance with the lower level will result in a product cost moving from \$1 to \$13, thereby pricing the product out of the market. That combined with the disproportionate impact of testing costs on small business, will surely result in some companies closing their doors permanently as a result of compliance with this law.

PPAI urges the CPSC to consider preserving the 300ppm for lead content.

Thank you.

Sincerely,

A handwritten signature in black ink that reads "Steve Slagle". The signature is written in a cursive style with a long, sweeping tail on the final letter.

Steve Slagle, CAE

**CPSC-2010-0080-0006.1:** Comment from Timothy Fenton

September 24, 2010

Office of the Secretary  
Consumer Products Safety Commission  
Room 502, 4330 East West Highway  
Bethesda, MD 20814

RE: Docket # CPSC-2010-0080

Children's Products Containing Lead; Technological Feasibility of 100 ppm for Lead Content

*Federal Register*, July 27, 2010 (Volume 75, Number 143) page 43942 - 43943

On behalf of Thermo Fisher Scientific Inc., I am commenting on the technological feasibility of meeting the 100 parts per million (ppm) lead (Pb) content limit for children's products. In particular, I will comment on the ability of handheld x-ray fluorescence (XRF) analyzers to measure for lead accurately at the proposed 100 ppm level.

Thermo Fisher, the world leader in serving science, is a publicly traded (NYSE: TMO) company that manufactures and distributes, among numerous other scientific products, instruments that use XRF technology to analyze and detect the elemental composition of materials.

### **Handheld XRF Analyzers**

Thermo Fisher has assisted many companies in establishing XRF testing programs, including retailers, distributors, importers, and manufacturers including low-volume manufacturers (LVMs) and handmade toy manufacturers. These XRF testing programs have become the basis of their Reasonable Testing Programs and complement third-party testing requirements that are or will be required under the Consumer Product Safety Improvement Act (CPSIA). Many customers have embraced XRF as a tool to assist them in complying with CPSIA requirements. Users appreciate these cost-effective, easy-to-operate, nondestructive tools, which allow them to perform reliable, extensive analyses quickly on a significant number of products or component parts. XRF testing provides them assurance of compliance with the CPSIA. XRF technology is also used by the CPSC in its lab, port and field operations.

### **Can XRF analyzers measure down to 100 PPM?**

*Regarding the feasibility of handheld XRF to provide accurate analysis at the 100 ppm level:*

Yes, this instrumentation is quite capable of analyzing to levels even lower than the proposed 100 ppm limit. The Limits of Detection (LODs) that handheld XRF analyzers can provide is

typically less than 10 ppm for most matrices (substrate materials) such as plastic, glass, ceramic, and recycled materials. LODs for metal matrices are higher, though still less than 100 ppm for most metal sample types. XRF detection technology continues to improve, and the LODs for Pb in metal matrices are also expected to continuously improve. I have attached materials showing our instruments' LOD for lead and other elements of potential interest in plastic, ceramics, glass and metal alloy matrices.

XRF technology is readily accessible, relatively easy to operate by a trained user, fast, and nondestructive. It is already embraced by many who are required to comply with the CPSIA. XRF can indeed continue to be of significant testing assistance even if the regulatory Pb level is lowered to 100 ppm.

I will be happy to answer any questions that the CPSC may have regarding these comments.

Sincerely,

Mark Lessard

# Thermo Scientific Niton XL3t GOLDD+ Series Mining Analyzers

## Elemental Limits of Detection in SiO<sub>2</sub> and SRM Matrices Using Mining Analysis

The Niton<sup>®</sup> XL3t GOLDD+ Series x-ray fluorescence (XRF) analyzer is the ultimate choice in features and performance. The chart below details the sensitivity, or LODs<sup>1</sup>, of the Niton XL3t GOLDD+ Series using mining analysis for an SiO<sub>2</sub> matrix, a typical soil matrix (SiO<sub>2</sub> with Ca/Fe), and SRM matrix.

In addition to the offices listed below, Thermo Scientific Niton Analyzers maintains a network of sales and service organizations throughout the world.

### Limits of Detection in ppm (mg/kg)

| Elements | Time Matrix | 60s per filter w/out He |      |                         |       |      |       |
|----------|-------------|-------------------------|------|-------------------------|-------|------|-------|
|          |             | SiO <sub>2</sub>        |      | SiO <sub>2</sub> +Fe+Ca |       | SRM  |       |
| Ba       |             | 35                      |      | 40                      |       | 45   |       |

Limits of detection (LODs) are dependent on the following factors:

- Testing time
- Interferences/matrix
- Level of statistical confidence

LODs are calculated as three standard deviations (99.7% confidence interval) for each element, using 60-second analysis times per filter.

#### Please Note:

Ongoing research and advancements in our Niton XL3t GOLDD+ Series analyzers will lead to continual improvement in many of the values detailed in this chart. Contact a Thermo Fisher Scientific office or your local representative for the latest performance specifications.

Actual analysis time is based on your requirements, and, in most cases, shorter times will give you the detection limits you require. For example, if analysis time was reduced from 60 seconds/filter to 15 seconds/filter, then the detection limits obtained would be twice the values shown in the chart. Similarly, increasing the analysis time will reduce the detection limits by the square root of the increased time.

A/S = Application-specific

## Consumer Goods Screening – Elemental Limits of Detection in Metals

In addition to the offices listed below, Thermo Scientific Niton Analyzers maintains a network of sales and service organizations throughout the world.

The Niton® XL3t GOLDD+ Series x-ray fluorescence (XRF) analyzer is the ultimate choice in features and performance for your toughest testing applications. These purpose-built instruments for consumer goods analysis utilize a proprietary Fundamental Parameters (FP)-based routine and Thermo Scientific TestAll technology for quick and accurate results on plastics, polymers, and metal alloy samples, including solders, with no user input.

The chart below details the sensitivity, or limits of detection (LODs)<sup>1</sup> of the Niton XL3t GOLDD+ Series for specific metal matrices. LODs are calculated as three standard deviations (99.7% confidence interval) for each element for a 60-second total analysis time.

Limits of detection (LODs) are dependent on the following factors:

- Testing time
- Interferences/matrix
- Level of statistical confidence

**Please Note:**

**CPSC-2010-0080-0007.1:** Comment from Russ Butson

Office of the Secretary  
U.S. Consumer Product Safety Commission  
4330 East West Highway  
Bethesda, MD 20814

September 24, 2010

**Subject:** Comments from Kolcraft in response to CPSC's request for comments on the technological feasibility of testing for lead in children's products at levels below 100 ppm as addressed in section 101(a) of the Consumer Product Safety Improvement Act (CPSIA)

Submitted Via: [www.regulations.gov](http://www.regulations.gov)

Hello:

This letter contains Kolcraft's comments on section 101(a) of the Consumer Product Safety Improvement Act ("CPSIA") which provides that, as of August 11, 2011, children's products may not contain more than 100 parts per million ("ppm") of lead, unless the Consumer Product Safety Commission ("CPSC"), determines that it is not technologically feasible. Kolcraft Enterprises, Inc. is a well-known and respected brand in juvenile products in the U.S. and internationally, and is proud of its record of safety and quality. Kolcraft welcomes the opportunity to comment on the proposed requirement.

#### COMMENTS ON THE YKK STUDY

Kolcraft agrees with the overall position of YKK as outlined in the July 19, 2010 issue of Product Safety Letter on the issue of whether or not a concentration of 100 ppm of lead is "technologically feasible". As YKK's twenty laboratory study shows, simply put and on its face, testing to these levels is not technologically feasible.

YKK's test of using 20 laboratories, "big ones that you'd know the names of" is a practical measure of whether results of a sample with a known lead concentration of approximately 71 ppm can be repeated within an acceptable range. This test is basically a gage reproducibility study as indicated by YKK that all labs were using inductively coupled plasma (ICP) technologies.

Kolcraft is confident in assuming that the labs used by YKK constitute a statistically valid sampling of the companies and locations which children's product manufacturers would and could use to test their materials. YKK reports that only half of those labs came within  $\pm 10\%$  of the target value of lead in the samples provided. This 10% range is in itself enough to cause concern. Even if all the labs were within this range, a material with a nominal lead concentration of 100 ppm could pass comfortably at 90 ppm or fail definitely at 110 ppm. To be practical for the purposes noted, results must be available consistently at less than approximately  $\pm 3\%$ .

However only half the labs provided results within even the  $\pm 10\%$  range. That one laboratory reported a concentration of zero ppm and another 331 ppm is problematic at both ends of the range. If a real sample at 71 ppm were tested and reported at 0 ppm, it does not create a problem *per se* as they both would be under the proposed statutory limit of 100 ppm. Of huge concern though is that the laboratory did not even provide a quantitative result as requested, but rather an inadvertent qualitative result and a failed one at that, determining that lead was not even present.

At the upper result of 331 ppm the lab reported a concentration that was 4.6 times the known concentration. Using this as an indicator a lead concentration of 22 ppm, very low by any perspective, could be reported as above the proposed 100 ppm limit. If this were to happen in a real-life production situation, where is a company to go to get accurate and repeatable test results which they can have confidence in?

It's easy to envision a company being confident in their material being tested as having significantly less than 100 ppm lead, receiving a failing test report, then having the same material retested by another lab and receiving a passing report. In this scenario, both test results have equal weight, and it's impossible to have more confidence in one result over the other. Will the manufacturer be accused of "lab shopping" to get a passing result? With no confidence in either result being correct, couldn't the CPSC be accused of "lab shopping" by choosing to recognize the failing result? If forced to use the failing result, the company is driven to solve a "high lead" problem that may not exist. And how do they prove they've "solved" the problem when results from the solution can't be trusted? Eventually this devolves into an exercise devoid of logic simply because there can be no confidence placed in the test results as YKK's study shows.

YKK's results provide a frightening picture of manufacturers' futures if the 100 ppm limit becomes statute. All results become suspect, even passing results as the manufacturer has little or no confidence that they will receive passing results again even on the same material. And the costs incurred to chase after solutions to problems that may not exist can become staggering for the industries affected. As such, the answer to the question of whether testing to lead levels of 100 ppm and below is technologically feasible is an emphatic "No!".

#### COMMENTS ON THE "PUBLIC HEALTH PROTECTIONS" ANALYSIS

Section 101(a)(2)(C) of the CPSIA states that before ruling that limiting lead concentrations to 100 ppm is not technologically feasible the CPSC must first analyze the public health protections that come from substantially reducing lead in children's products. We presume this analysis is to provide data to be used pursuant to paragraph (D) which would allow a limit to be set between 100 ppm and 300 ppm.

Kolcraft urges caution in the design and performance of this analysis. Certainly, if it shows there is no benefit from substantially reducing lead in children's products, then there is no basis to reduce lead limits from 300 ppm to 100 ppm or anywhere in between. And while not prejudging the results of an analysis yet to be performed, if it shows there is a benefit, it must do so in light of children's exposure to background levels of lead that already exist in their environment.

It is commonly accepted the two sources of lead identified as being most accessible to young children are in the home, primarily from old lead-containing paints in homes that are not at least minimally maintained, and from dirt which became contaminated in the years that tetra-ethyl lead was used to enhance octane ratings of gasoline. Lead-containing paint dust is ubiquitous in older homes where painted surfaces are not maintained. And anecdotally the average concentration of lead in soil is approximately 40 ppm, the soil which children play on and in, and where lead particles can be easily ingested or inhaled. Contrast this with the current low limit applied to children's products together with any lead typically being encapsulated in either a plastic or metal matrix, trapped in a way that they cannot likely be released in any quantity sufficient to raise a child's blood lead level even if a child should chew or suck on the material. Therefore background levels of lead exposure are likely to be orders of magnitude higher than exposure levels due to a child's interaction with materials they encounter in the products they use.

Kolcraft strongly supports the analysis required by section 101(a)(2)(C), and believes it will show no benefit of enacting a level between 100 ppm and 300 ppm in light of a child's existing background levels of lead exposure and considering the relative inaccessibility of lead that is bound in a plastic or metal matrix is minimal. Should this be the case we would also urge caution, as this subject can often be driven by emotion and good intentions, in the

application of the precautionary principle to reduce the limit below 300 ppm as this would, in effect, indicate that the analysis was inadequate.

Summary

Again, thank you for the opportunity to respond to these proposed changes as required by the CPSIA. To reiterate, we support YKK's conclusion that currently commercial labs are not capable of accurately and repeatably measuring lead concentrations is the area of 100 ppm. As the CPSIA requires, this measurement is therefore not *technologically feasible*. Additionally, we have very serious objections to dropping the lead requirement to a value between 100 ppm and 300 ppm unless data can conclusively show this limit can be measured accurately and repeatably by commercial laboratories and that CPSC's analysis shows that doing so can reduce lead levels in children's blood in light of background levels of exposure.

Re: Docket No. CPSC-2010-0080: Children's Products Containing Lead; Technological Feasibility of 100 ppm for Lead Content; Request for Comments and Information (75 Fed. Reg. 43, 942 (July 27, 2010))

Dear Mr. Stevenson:

These comments are submitted on behalf of Kawasaki Motors Corp., U.S.A. ("KMC") in response to the U.S. Consumer Product Safety Commission's ("Commission" or "CPSC") notice requesting information on the technological feasibility of meeting the 100 ppm lead content limit as of August 11, 2011, pursuant to Section 101(a) of the Consumer Product Safety Improvement Act ("CPSIA"), for various children's products. KMC is a distributor of all-terrain vehicles and off-road motorcycles designed and intended primarily for children 12 years of age or younger ("youth motorized recreational vehicles").

On May 12, 2009, CPSC issued a stay of enforcement until May 1, 2011 of the then current 600 ppm lead content limit for youth motorized recreational products. See 74 Fed. Reg. 22,154. The Commission issued the stay of enforcement in order to afford manufacturers (or importers) of such vehicles an appropriate amount of time to conduct the testing, research and development necessary to bring metal alloy component parts of such vehicles into compliance with the CPSIA and to identify any such parts that are either technologically infeasible to bring into compliance or where such compliance, while technologically feasible, would expose children to other and greater safety risks. Id. at 22,157.

In addition, the stay of enforcement provides that any manufacturers who need additional time to complete this testing and research and development may seek an extension of the stay by filing such a request no later than December 1, 2010. Any such request for an extension must, among other things, provide information regarding the lead content of representative samples of particular metal components containing more than the current CPSIA limit of 300 ppm, as well as information as to why any such parts have not been

**ECKERT  
SEAMANS**

Mr. Todd A. Stevenson  
September 24, 2010  
Page 2

able to be made inaccessible, substituted with another material, or made with a complying level of lead.

CPSC should thus be aware that to the extent any such requests for extension of the stay of enforcement regarding youth motorized recreational vehicles are filed on or before December 1, 2010, it is therefore likely they would also provide information indicating that it is similarly not technologically feasible to apply as of August 11, 2011 the even lower limit of 100 ppm for lead content of certain identified metal alloy components of such vehicles.

KMC appreciates the opportunity to submit these comments in response to the above referenced CPSC notice.

Respectfully submitted,

Michael A. Wiegard  
Counsel for Kawasaki Motors Corp., U.S.A.

## General Comment

Regarding this consultancy I am writing on behalf of the mexican footwear industry after an agreement with the Guanajuato State Footwear Manufacturers Chamber, that represents to the footwear manufacturers sector in Mexico; the Guanajuato State Commission for the External Trade Promotion that represents to the state government and our institute CIATEC that is a CPSC accredited third part laboratory to test the Lead content in children products according to 16 CFR 1500.

After that we have discussed and analyzed the results of testing products from more than 150 manufacturers of finished footwear and footwear materials and components, in order to be certified as shoe imports to the USA market, we have found and concluded that the limit of 100 ppm Lead content can be technologically feasible.

Re: Comments Regarding the Technological Feasibility of 100ppm for Lead Content Under the Consumer Product Safety Improvement Act (CPSIA) [Docket No. CPSC-2010-0080]

Dear Mr. Stevenson:

On behalf of the Handmade Toy Alliance, an alliance now numbering 548 toy stores, toymakers and children's product manufacturers from across the country who want to preserve unique handmade toys, clothes, and children's goods in the USA, we respectfully submit the following comments regarding the technological feasibility of a 100ppm lead content limit.

We wish to reiterate that the CPSC and the Congressional leadership from both parties have openly acknowledged that the broad sweep of the CPSIA has created unintended consequences for products and industries which had nothing to do with the toy and jewelry safety scare of 2007. In light of the fact that Congressional Democrats and Republicans have so far been unable to work together to craft a solution for the small businesses we represent, it remains up to the Commission to promulgate rules that serve to help businesses large and small to understand what is needed to comply with the CPSIA.

As with the rulemaking process regarding the definition of a children's product, we believe that Congress has given the Commission an important opportunity to avoid further unintended consequences by ruling that the 100ppm limit on lead in substrates is not a feasible standard.

First and foremost, we believe that total lead is not a reasonable standard for evaluating the risk of lead poisoning from a consumer product. Whether the limit is 300ppm or 100ppm, a total lead standard is a purely political, not a scientific, assessment of risk. Despite the fact that no scientific study directly correlates total lead content with the risk of lead

poisoning, consumer groups insisted during the drafting of the CPSIA that a “bright line” total limit, which was easier to measure, enforce, and explain to the public, was preferable to a soluble standard which more accurately reflects risk.

This key difference has unnecessarily set the US market apart from other markets, in particular the European Union, and has cost millions of dollars worth of redundant testing.

We have been arguing for two years that the US should adopt the European Union's method of evaluating the risk of lead exposure by measuring the bioavailability of soluble lead in substrates. By defining the limits based on total lead, the CPSIA has effectively outlawed materials such as brass, crystal, and rhinestones which are perfectly safe biologically yet violate the CPSIA's limits on total lead.

Now we are being asked to comment on whether a 100ppm standard would be “technologically feasible”. Most of the comments the commission will receive on this issue will likely focus on the word “feasible”. We, however, would like to argue that a 100ppm limit is not *technological*.

The simplest definition we found of the word “technology” is: *The practical application of science to commerce or industry.*

Because science shows that a total lead limit does not actually measure the risk of lead poisoning, such a limit, whether it is 300ppm or 100ppm, cannot be described as the application of science to commerce or industry. It may represent the application of political expediency or good intentions, but it is not an application of science. Therefore, reducing the limit from 300ppm to 100ppm would merely be compounding and increasing the side-effects of an unscientific principle. Whether or not 100ppm is feasible, it is not technological.

We agree that consumer products should be regulated by “bright line” standards, but these should be based on science and common sense. For example, we had hoped that the Commission would adopt clear and easy to understand standards when it recently considered the definition of a children's product. Instead, our comments seeking clear standards were ignored, as were the comments of many other stakeholders. The Commission staff chose to issue a 63 page definition which provides no bright lines and no clear definition. HTA member Sarah Natividad, the owner Curious Workmanship, a home-based business in Utah, observed:

*[The CPSC] could have saved hard drive space, several forests of trees, and a lot of time and effort by just making the rule say “It’s a children’s product if we say it is, so just ask us and if we feel like it, we’ll decide for you.” Because that’s what it boils down to. Now, besides the fuzzy line between kids and adults, we also have the fuzzy line between infants and kids and whether a child might reasonably be assumed to touch and use a lamp or a piece of furniture. Why on earth did they think TWO fuzzy lines constituted clarification?*

Indeed, in the weeks since the final draft of the definition was published, the CPSC has illogically re-defined the intended age of at least two products so that it could initiate recall

procedures. The first was a recall of Click Armband Bracelets by Fun Stuff, Inc., which were clearly marked as designed for ages 3 and over. Despite the fact that no responsible parent would give these throwaway plastic toys to a toddler, the Commission chose to initiate recall proceedings by redesignating them as toddler toys.

In the second recent case, a line of mood rings were reclassified by the Commission as a children's product despite the fact that they were clearly labelled with sexually suggestive language which was specifically designed to appeal to teenagers and adults, not children.

By issuing an obfuscating definition of a children's product and by creatively reclassifying products so that it can force recalls, the Commission is doing everything except promulgating bright line standards. These actions do not go unnoticed. They tell children's product manufacturers both large and small only one message: there are no bright line standards, only the will of Commission.

The end result of this uncertainty is a growing realization that any children's product business, no matter how responsible or how ethical, is just one incident report away from terrible penalties and overwhelming legal fees. Small businesses like our members lack the resources to defend themselves from the Commission's unilateral actions and are increasingly choosing to exit the children's' product marketplace altogether.

So, in this environment, is a 100ppm limit feasible? Consider the analysis, included in full below, by Sarah Natividad, who is also a former mathematics professor. She concludes that the more we test and the stricter we make our standards, the more impossible it is to comply with the law. She writes:

*It is mathematically impossible to find all defective objects without going to the expense of testing them ALL. And that's assuming testing is 100% accurate, which it's not. And to add insult to injury, the more zealously you test by sampling, the more confused you will be about the safety of your product. CPSIA was supposed to reduce confusion about product safety, but now you have mathematical proof that it does exactly the opposite.*

This mathematical paradox will be dramatically aggravated by lowering lead limits to 100ppm--a limit which makes sampling errors, random chance, and the accuracy of testing equipment much more likely to play a decisive role in the outcome of both pre- and post-market product safety evaluations. Testing costs will increase, uncertainty will increase, risk of destroying finished inventory will increase, and the number of CPSC recalls will increase. The result will be weakened businesses, undermined consumer confidence, and a public even more inured to the product recall process.

As small manufacturers, we lack the wherewithal to demand consistent compliance to such a low standard from our component suppliers, many of whom do not specifically manufacture for children's products. We lack the resources to test repeatedly to ensure that any given tests results are actually within a 100ppm limit given the tests' margins of error. And, in an environment where the Commission blurs bright lines, we lack the patience for such a low limit that has no impact on human health but could well jeopardize our family businesses.

Thank you again for taking the time to read and consider our comments.

Respectfully Submitted,

The Handmade Toy Alliance

## **CPSIA And The Stochastic Approach**

Searching for certainty is an entirely noble human endeavor. We long for the days when we were younger, when Mom or Dad could hold us in their arms and we would know we were safe. As we become adults, we venture out into the cold, uncertain world, and eventually we learn to live there by sticking to the course we feel most likely to bring a good outcome.

Groups like Consumer's Union seem to me to be taking an immature approach to the problem of lead in children's products. They wanted CPSIA because they believed it would make us safe from all lead, forever. If only Congress had that power. Congress has the power to make laws, but they do not have the power to make people 100% safe. Even if CPSIA is fully implemented, we will not be 100% safe from lead. Setting aside the fact that most lead exposure comes from lead in house paint, let's take a look at why this is.

We are going to use what nerds like me call a "stochastic," or probability-based, approach. Probability is the most counter-intuitive branch of mathematics, so I'll do my best to explain this approach in layman's terms.

Suppose a clothing manufacturer, let's call him Ben, buys 10,000 metal snaps from a snap manufacturer, Jessica. Ben wants assurances that Jessica's snaps are CPSIA compliant to the 100ppm standard. So Jessica pulls out her XRF gun and tests 100 snaps (that's 1% of the snaps), and they all test around 60ppm, near but under the lead content limit.

Ben and Jessica now both believe all 10,000 snaps are compliant, but there's something they don't know. Due to random fluctuations in the lead content of the snaps, 200 of the 10,000 snaps exceed 100ppm. Neither Ben nor Jessica can know this, because they have no way to know without testing all the snaps. Now, if Jessica wants absolute certainty, she can test each and every one of the 10,000 snaps. But Jessica does not have time for this, and neither does Ben. Also, if Jessica were to task one of her employees to do this, it would raise the cost of the snaps so much that Ben could not afford them. So Ben and Jessica feel this is good enough.

Now Ben has used the snaps in his clothing line. He sends 25 garments that have 4 snaps each (total of 100 snaps) off to a Third Party Lab for testing in compliance with CPSIA. When he gets the results back, he finds that two of the snaps have failed.

Now Ben is in a deep fix. The failed snaps were on a size 4 green shirt and a size 10 blue shirt, but it would make no sense to pull all the size 4 green shirts and size 10 blue shirts, because the 200 defective snaps are now randomly distributed throughout his entire clothing line. Ben can have every one of the snaps tested and pull the garments that have

failed snaps. Or he can pull the entire line, losing all the money he'd hoped to make from it. Or he can sell the clothing anyway and hope nobody notices a few defective snaps.

Here's what Ben and Jessica didn't know, but we can figure out:\* The original testing results were somewhat of a fluke. The chance that all 100 snaps in any given sample would pass, given the numbers we chose at the outset, was actually only about 13%. This means that in any other sample of 100 snaps, the chance is about 87% that at least one of them will fail. If Ben sells his clothing line and the CPSC comes by and randomly tests 100 of his snaps, he has an 87% chance of them finding a failed snap, forcing him to recall the entire line. If there were an 87% chance of rain today, you'd bring your umbrella. This makes selling the clothing line untenable, because CPSC audits are not random. Perhaps Jessica also supplies another clothing company that ended up doing a recall because of lead in the snaps, and that puts all the other companies Jessica supplies under the microscope.

So, having been burned, Ben and Jessica resolve to do something about the problem. Jessica can get more expensive, purer metal, so that there are only 10 defective snaps out of every 10,000. Jessica can also test more snaps. The more snaps Jessica tests, the greater the chances she'll find defective ones; but unless she tests them all, she has no way of knowing whether she's gotten them all-- and one might slip through and jeopardize Ben's clothing line again. In fact, even if Jessica is able to reduce the number of defective snaps to 10 out of 10,000 and tests 500 snaps from every 10,000, she still runs a 40% chance of finding a defective snap in her testing. Ben's safer now, but if he keeps his testing regimen unchanged, he still has a 10% chance of finding defective snaps in his clothing line. That's down from the 87% chance he had before, but it's not certainty. Ben's financial backers (maybe a bank, maybe his family) might not find palatable a 10% chance that the entire clothing line will be unsalable. That's like rolling a pair of dice and hoping it doesn't come up with a sum of 5.

It gets worse. Suppose Jessica gets really zealous and decides to not only improve the quality of her metal so that there are only 10 defectives in 10,000, but she also decides to test 1000 out of every 10,000 snaps. (Assume for the moment that the extra cost of all this doesn't bankrupt Jessica or turn off her customers.) Now it's Jessica that has the problem: every time she runs a test of 1000 snaps, she has a 63% chance of finding at least one defective snap. She can throw out the defective snaps as she finds them, and since we know there are only 10, eventually she'll get them all, though as a practical matter it'll be easier to just test every snap than to keep testing lots of 1000 snaps. But unless Jessica tests every snap, she will not know she has found them all. Remember, *Jessica does not know* exactly how many defective snaps there are in each batch of 10,000. We know because in this example we're the omnipotent observer, and we set the conditions of the problem. But as a practical matter, we don't know how many defectives are out there in any given batch of anything!

Jessica *knows* her snaps are (mostly) safe. She tests them over and over and gets pass, pass, pass, pass, pass. But Jessica *still cannot guarantee* Ben that his product line won't be jeopardized by using her snaps, no matter how much she tests and tests and tests, unless she tests all the snaps one by one. Ben is in the same fix if Jessica cannot test all the snaps: he cannot guarantee that even if his lot of samples passes testing, that there are no defective snaps in the entire batch. The only way to guarantee it is for somebody to test all 10,000 of the snaps.

**Bottom line: it is mathematically impossible to find all defective objects without going to the expense of testing them ALL.** And that's assuming testing is 100% accurate, which it's not. And to add insult to injury, **the more zealously you test by sampling, the more confused you will be about the safety of your product.** CPSIA was supposed to *reduce* confusion about product safety, but now you have mathematical proof that it does exactly the opposite.

Now we apply our findings to the issue of protecting children from lead exposure.

In practice, Jessica can only test samples of her snaps. And CPSIA only requires Ben to test samples of his shirts. There is a probability, however small, that a defective snap will slip past both Jessica's AND Ben's testing, and be discovered by, say, a consumer group doing in-store testing as a public service. This will put both Ben and Jessica in a real fix. They both did their due diligence under CPSIA. Ben did all the required testing, and he vetted his supplier properly. Since suppliers aren't liable under CPSIA, Jessica went above and beyond the call of duty. And still a defective snap got through. And think about the retailer of Ben's clothing line. Ben provided a 100% accurate General Conformity Certificate-- it was based on tests run by a third party, which turned up no lead in the snaps. The retailer had every reason to believe that Ben's clothing line was perfectly safe-- and is now in jeopardy along with Ben.

Let's put some numbers to this. Suppose Jessica decides that testing samples of 200 snaps is adequate, and Ben still tests 100 snaps on the garments in his line; and let's suppose that Jessica used the purer metal so there were only 10 defective snaps in the lot of 10,000. The chance that both their tests detect no defective snaps is 74%, meaning that they stand about a 1 in 4 chance of actually, unknowingly passing a defective snap on to the public. If you were a retailer, would you want to take that chance? And that's just one clothing line. If the retailer carries 20 children's clothing lines similar to Ben's and they all have the same chance of having undetected lead in the snaps, it is very nearly certain that *something* in the retailer's store is noncompliant. The retailer is going to be just fine-- unless, of course, somebody spreads rumors that their store is noncompliant. If the CPSC or the state Attorney General decides to check their store for noncompliant clothing instead of just checking their GCCs, they are so totally screwed.

**Thus we see that CPSIA, strict and wasteful as it is, is still not capable of preventing lead exposure.** And what's worse, it holds over each manufacturer's and retailer's head a significant chance that even if they do everything right, they can still be fined, or worse, jailed. People in business are used to taking risks, but that doesn't mean they're all willing to take the largest possible risks.

Sorry, Consumer's Union, your Mommy and Daddy are only human after all.

\* Mathematics aficionados will recognize this as a binomial probability distribution with  $n=100$  and  $p=.02$ , under the assumptions that defective snaps are indistinguishable from good snaps, and that XRF testing is perfect at detecting lead levels (it isn't; it does 95% confidence intervals, making these results even more uncertain).

Re: Docket No. CPSC-2010-0080: Children's Products Containing Lead; Technological Feasibility of 100 ppm for Lead Content; Request for Comments and Information (75 Fed. Reg. 43,942 (July 27, 2010))

Dear Mr. Stevenson:

These comments are submitted on behalf of Yamaha Motor Corporation, U.S.A. ("Yamaha"), a manufacturer/distributor of all-terrain vehicles and off-road motorcycles. The comments respond to the notice issued by the U.S. Product Safety Commission ("CPSC") requesting information on the technological feasibility of meeting the 100 ppm lead content limit for various children's products as of August 11, 2011, pursuant to Section 101(a) of the Consumer Product Safety Improvement Act ("CPSIA").

On May 12, 2009, CPSC issued a stay of enforcement until May 1, 2011 of the then current 600 ppm lead content limit for youth model motorized recreational products. *See* 74 Fed. Reg. 22,154 (May 12, 2009) ("Stay"). The Stay affords manufacturers (or importers) of such vehicles additional necessary time to conduct the testing, research and development required to bring metal alloy component parts of such vehicles into compliance with the CPSIA and/or to identify parts that are either technologically infeasible to bring into compliance or where such compliance, while technological feasible, would expose children to other and greater safety risks. *Id.* at 22,157.

The Stay also provides that any manufacturers (or importers) who need additional time to complete these efforts may seek an extension of the stay period by filing a request no later than December 1, 2010. Any extension request must provide information regarding the lead content of representative samples of particular metal components containing more than the current CPSIA limit of 300 ppm, as well as information as to why any such parts have not been able to be made inaccessible, substituted with another material, or made with a complying level of lead. Thus, to the extent that requests to extend the Stay are filed on or before December 1, 2010, such requests will likely contain information

Mr. Todd A. Stevenson  
September 27, 2010  
Page 2

indicating that it is similarly not technologically feasible to apply, as of August 11, 2011, the even lower limit of 100 ppm for lead content of certain identified metal alloy components of such vehicles.

Yamaha appreciates the opportunity to submit these comments in response to the above referenced CPSC notice.

Respectfully submitted,

  
David P. Murray

**Re: Technological Feasibility of 100 PPM for Lead Content (CPSIA)  
Docket No. CPSC-2010-0080**

◆  
*AmCham HK represents the interests of a wide variety of textile, apparel & footwear companies that are impacted by the recently passed consumer product safety legislation known as the CPSIA. AmCham HK companies supporting this effort wish to express the strongly and uniformly held view that product safety is a fundamental priority in the design, development, manufacture, and distribution of textile, apparel and footwear products for U.S. consumers.*

Pursuant to the CPSC's Federal Register notice, 75 F.R. 43942 (July 27, 2010) requesting comments on the feasibility of the proposed 100 ppm lead in substrate standard, the members of Amcham HK have undertaken a scientific study on existing products manufactured to this standard and attach the results hereto as **Attachment 1: Study on the Level of Lead in Substrate in Different Metallic Components used in the Toys Industry.**

As shown in **Attachment 1**, the results of the study show that, generally, products produced to this stricter standard are compliant, however, there remains a small, but statistically relevant percentage of products that fail the 100 ppm standard.

The first column in **Attachment 1** shows the level of lead content in the substrate of each component. The second column classifies each component tested into a range of lead limits (less than 10 ppm, between 10 and 20 ppm, etc.) with the corresponding percentage of tested components that are below the limit.

As shown, 99.54% of the components tested are below 100 ppm; 99.95% are below 300 ppm. While a large majority of the components pass the more stringent standard, there is still a failure rate in 0.46% of the cases. For those brands/retailers with thousands of products per year, this means at the very least that several failures will occur simply through statistical odds.

It is important to reiterate that the move from 300 ppm to 100 ppm in lead in substrate will not necessarily result in safer products. The critical issue is not the actual level of lead in the substrate, but the possibility of the leachable lead in the substrate to be actually absorbed into the body of a child.

Thus, the members of HK Amcham propose that since there is a statistically valid failure rate at the 100 ppm lead limit (*six sigma* approach), the CPSC retain the current 300 ppm lead in substrate standard, but further establish a voluntary standard on the level of leachable lead in the substrate.

The HK Amcham therefore recommends that CPSC retain the current limit at 300 ppm. The voluntary standard would require a 90 ppm lead level in substrates for leachable lead. This also matches to the current standard in force in Europe, a standard to which most of the HK Amcham members and their supplier factories are currently producing to. This also furthers the goal, consistently advocated by HK Amcham members, to move towards obtainable and realistic global standards. This would further reduce testing costs and the time required to perform multiple tests under different standards for different part of the world.

AmCham HK companies commend the CPSC on its recent actions taken to rationalize testing, waive testing for excluded materials, and reduce burdens on the manufacturing community while ensuring compliance with the letter and spirit of the CPSIA. We believe the proposals above would further these efforts while setting reasonable and obtainable global standards.

Respectfully submitted,  
AmCham HK  
Apparel & Footwear Committee  
Product Safety Subcommittee

RE: CPSC Docket No. CPSC-2010-0080

Dear Sir or Madam:

Consistent with Toys“R”Us, Inc’s commitment to children’s product safety, we are writing to you to provide our comments pursuant to the Commission’s request for information regarding the technological feasibility of reducing the substrate lead limit in children’s products to 100ppm as required by section 101 of the Consumer Product Safety Improvement Act of 2008 (CPSIA). We very much appreciate the opportunity to provide you with input on this topic.

We would like to state at the outset that, as a retailer, we do not always have knowledge of the feasibility of achieving compliance for a specific component, material, or manufacturing process, but because we maintain a robust safety testing program, we have amassed data that, when taken together with general materials and manufacturing knowledge, strongly suggests that some classes of materials will have difficulty *consistently* meeting a 100ppm limit.

Those materials which we believe will have difficulty consistently meeting such a limit are:

**A) Metals**

With the exception of common stainless steels, we have found levels of lead which would be problematic relative to a 100ppm limit in a wide variety of metal components. The issue appears to be common in copper, brass, and bronze alloys, solders used in non-electronic applications, and fasteners such as screws, staples, rivets, eyelets, crimps, snaps, zippers, etc. This appears to reflect a requirement for low concentrations of lead in materials intended to be cast (to facilitate adequate flow in the molten state); machined (to promote chip/swarf breakage to prevent machine damage and/or operator injury); and/or formed (to allow adequate deformation without material fracture); as well as the somewhat heterogeneous nature of some alloys.

## B) Glass and Ceramics

We are finding low (but above 100ppm) concentrations of lead in some glass and ceramic components which are either colored or which require machining, polishing, or a specific optical characteristic such as clarity or refractive index.

We have not encountered evidence that other classes of materials cannot be produced to comply with a 100ppm limit; for example, while we sometimes encounter plastic substrates above 100ppm, the preponderance of evidence would suggest that most plastic components can be made to consistently meet this level. The one additional comment regarding plastics that we would make is that a 100ppm limit, although apparently achievable, appears to require the use of virgin material to do so; the need to consistently meet a 100ppm lead limit removes the option of using recycled material.

We have enclosed relevant test data outlining a variety of components and their corresponding substrate lead level by test; we would like to reserve the right to supplement our comments as more data become available.

We once again thank you for the opportunity to comment, and recognize that the Commission has a difficult task as it works to assure the safety of children's products while attempting to also accommodate the needs of multiple stakeholders and supply chains. We thank you also for your efforts to improve children's product safety.

Sincerely,

A handwritten signature in black ink, appearing to read "Alan P. Kaufman", with a long horizontal flourish extending to the right.

Alan P. Kaufman  
Vice-President-Global Product Safety, Quality Assurance, and Compliance  
Toys"R"Us, Inc.

**Re: Docket No. CPSC- 2010-0080**

**Comments: Technological Feasibility of 100 ppm for Lead Content in Children's Products**

These comments are provided by the Toy Industry Association (TIA) on behalf of its members and the U.S. toy industry. TIA has as membership of more than 500 toy manufacturers and importers that collectively account for approximately 85% of annual U.S. domestic toy sales.

TIA commends the efforts of the Consumer Product Safety Commission (CPSC) staff to gather relevant information in fulfillment of Section 101 of the Consumer Product Safety Improvement Act of 2008 ("CPSIA") relating to the practicality of reducing lead limits from 300 ppm to 100 ppm of lead as of August 14, 2011, unless the Commission determines that it is not technologically feasible. We agree that it is essential for the CPSC to consider the feasibility of requiring such reductions for certain materials and components of articles that are defined "children's products" under the CPSIA. We are pleased to submit some initial comments for staff consideration.

Section 101(a) of the CPSIA (15 U.S.C. 1278a(a)) provides that, for products designed or intended primarily for children 12 years old and younger, the total lead content limit by weight in any part of a children's product is limited to 300 ppm as of August 14, 2009, and 100 ppm of lead as of August 14, 2011, unless the Commission determines that it is not technologically feasible to have this lower limit for a product or product category. The Commission may make such a determination after notice and a hearing and after analyzing the public health protections associated with substantially reducing lead in children's products. If the Commission determines that the 100 ppm lead content limit is not technologically feasible for a product or product category, the Commission shall, by regulation, establish the lowest amount below 300 ppm that it determines is technologically feasible.

Unless granted a specific exclusion or determination under the Commission's regulations at 16 CFR 1500.87 through 1500.91, children's products, including the components parts of children's products, are subject to the lead limits and also to the testing and certification requirements of section 14(a)(2) of the Consumer Product Safety Act ("CPSA"). (15 U.S.C. 2063(a)(2)).

The Commission has requested comment and information concerning the technological feasibility of meeting the 100 ppm lead content limit for children's products that are not otherwise excluded from the lead limits under its current exclusionary rule. Section 101(d) of the CPSIA (15 U.S.C 1278a(d)) provides that a lead limit shall be deemed technologically feasible with regard to a product or product category if:

- (1) a product that complies with the limit is commercially available in the product category;
- (2) technology to comply with the limit is commercially available to manufacturers or is otherwise available within the common meaning of the term;
- (3) industrial strategies or devices have been developed that are capable or will be capable of achieving such a limit by the effective date of the limit and that companies, acting in good faith, are generally capable of adopting; or
- (4) alternative practices, best practices, or other operational changes would allow the manufacturer to comply with the limit.

The Commission has requested information on the feasibility for manufacturers to meet the future 100 ppm lead content limit for specific children's products or product categories. The CPSC has requested that comments address products or materials that currently comply with 300 ppm lead content limit which are required to meet the 100 ppm lead content limit effective August 14, 2011.

### **Plastic Materials and Components**

Non metallic materials can generally meet the 100 ppm lead requirements consistently and compliance with a 100 ppm limit is technologically feasible. However, there continues to exist a concern in the marketplace about variations in testing methodology and procedures, globally, that likely result in some variations in test results. With increasingly lower limits being imposed to minute trace levels, it is essential that such variability be reduced or eliminated or recognized as a matter of enforcement policy. Based upon reported complaints, it is essential that the potential for environmental contamination of tested samples or variability in test results from test methods employed be recognized and that a sufficient margin of error be recognized as a matter of enforcement policy.

### **Certain Metal Components**

The Association has submitted production representative samples that contained a variety of metal components including fasteners, axles, screws, nuts, shafts, bushings, gears, rivets, springs, rods, shafts, antennas, lock pins, and battery contact plates for independent laboratory testing. Upon examination of the toys we sought to identify those metal components that may be accessible but would not be defined as small parts, reasonably at risk of ingestion by a child<sup>1</sup>. Certain electronic components<sup>2</sup> and other metal components that could not reasonably be

---

<sup>1</sup> Section 101(b)(2) of CPISA specifies that a component part is not accessible if it is not physically exposed by reason of a sealed covering or casing and does not become physically exposed through reasonably foreseeable use and abuse of the product. Paint coatings or electroplating may not be considered to be a barrier that would render lead in the substrate to be inaccessible to a child.

<sup>2</sup> 16 CFR §1500.88 Exemptions from lead limits under section 101 of the Consumer Product Safety Improvement Act for Certain Electronic Devices, February 12, 2009.

accessible without intentional disassembly or destruction of products<sup>2, 3</sup> were not tested. We also reviewed representative individual metal components (fasteners, wheel bushings, screw and shafts). These parts were assumed to be accessible for the purposes of reviewing generally available supply chains for such component parts. In general, the toy industry relies upon components of this type that are produced by the fastener industry.

While many such hardware components tested below 100 ppm, certain component materials sample such as wheel bushings, screws and shafts had reported lead concentrations in excess of 100 ppm based on ICP-MS testing methodology. Another set of components consisting of fasteners and an axle also had reported lead content concentrations in excess of 100 ppm total lead by weight based on XRF testing. Such components when used on electronic toy product are excluded from the lead limits under the noted exemption. Yet, illogically the same component parts in non-electronic toys are not similarly excluded. In both scenarios no human health hazard exists.

All such component items, were also subject to lead wipe (conforms to ASTM Standard E 1792 Specification or Wipe Sampling Materials for Lead in Surface Dust) and saline sampling<sup>4</sup>. These assessments are consistent with the CPSC's assessment of mouthing behaviors. Leaching-test results were presented in micrograms of lead leached per gram of material ( $\mu\text{g/g}$ ) extracted by a certain extract (e.g., "simulated saliva" or saline solution to mimic mouthing behavior) over time. Although it is plausible under normal and reasonably foreseeable use and abuse situations that some portion of the component may be touched, for representative components containing lead concentrations higher than 100 ppm, no lead was accessible for potential exposure based on wipe sampling data and based on saline extraction test data so as to pose a health risk from incidental handling or mouthing.

### **Laboratory Test Exhibit Variation**

When metals such as lead that are contained in other metals such as steel are tested there can be issues with the extractability of the suspect metal as well as errors in measuring the amounts of lead. Tests conducted by zipper manufacturer YKK5 suggest that the reliability of current state of the art testing of materials that contain less than 100 ppm lead is questionable. Given that, materials that meet the requirement on one test could fail another, a manufacturer could test at the beginning of their first production run and ship products to the market only to have a subsequent test fail that could require recall of the first production batch due to testing variations.

Test methods are critical when testing for lead at 100 ppm. Slight variations from one lab to another will likely result in products passing one test and failing another. Metallurgists and chemists indicate that errors can occur when several metals are in the same sample, i.e. steel and

---

<sup>3</sup> Per CFR 16 CFR §1500.87, components that could only be available to children through intentional disassembly or destruction of products by children older than age 8 years by means of knowledge not generally available to younger children, including use of tools, are not considered in evaluating products for accessibility of lead containing components.

<sup>4</sup> U.S. EPA.2008. Child-specific exposure factors handbook; Juberg DR, Alfano K, Coughlin RJ, Thomason KM. 2001. *An observational study of object mouthing behavior by young children*. <sup>5</sup> Product Safety Letter- August 11, 2010, "Is it Feasible to Test the Feasible", Sean Oberle

lead, due to the readings from the primary metal interfering with the results of other metals that are present in smaller amounts.

Alloys can have a considerable range of extractability so extraction methods are also critical. Any variation in the method can influence the results given the small amounts of lead that are in the samples. It may be too early to know all of the ramifications of these issues which makes it all the more important for the CPSC to carefully explore the magnitude of potential problems before implementing a standard that can cause serious disruptions in the marketplace.

### **Data Reported on Testing of Accessible Metal Components and Fasteners**

The Commission also seeks comment on any other factors that could affect compliance with this requirement. Specifically, CPSC has expressed an interest in products and materials that currently do not meet the 100 ppm lead content limit, but could meet the 300 ppm lead content limit, including but not limited to information and test data showing the lead content of such products or materials. Based upon reported data from members, the probability of an assembled product failing is in the 2-3% range. Annexed is an Appendix table of binomial calculations that show what the expected failure rates are for products with 1-20 accessible components when the test failure rate is 2.3% (based upon lab reported results). Note that one out of every five products with 10 components (not an unusual number) could have one or more components fail when tested. With 20 components, 37% of the products will have one or more components fail. This occurs because certain metal components comprised of general use fasteners and other metal parts, that may be used in toys cannot practically be produced in a controlled fashion without a globally sanitized supply chain. Lead occurs naturally and can be a contaminant in other metals. In order to eliminate lead from other metals, refinement is necessary which drives up costs. There are limits to which given elements can be removed from an alloy, so that even lead free metals can be contaminated due to machining, recycling and recovery. Lead may be used to modify properties of steel to facilitate machining. Steel can contain 0.015 - 0.35% (150 – 3500 ppm) lead. Lead, due to its low melting point, acts as a lubricant during machining. While other additives, such as bismuth, can be used instead of lead the process is proprietary which makes it an expensive and less feasible alternative<sup>6</sup>.

Die cast zinc used in the manufacture of toys contains 20 – 50 ppm lead. This leaves a very narrow window of acceptance since very small amounts of contamination combined with testing variations could push the level past 100 ppm. In addition, zinc used to coat steel to prevent corrosion also may contain lead. With reclamation of zinc from various sources, the probability is high that zinc will contain more than 100 ppm lead. Given the nature of these component parts and the fact that manufacturers of toys cannot reasonably or technically exert control over the production and supply of such metal component parts, an automotive reduction in lead limits for such parts should not be imposed.

Finally one member laboratory reported that with tens of thousands of tests conducted almost 50 percent of metals tested could achieve less than 300 ppm, but not less than 100 ppm. This indicates that given the state of the art in metallurgy 100 ppm is not technologically feasible for all metals. This issue raised was in addition to detection limits in the range of 30 ppm. Simply

---

<sup>6</sup> Production Machining, March 15, 2002, Chris Koepfer, Editor, "Anatomy of Free Machining Steel".

put, this data raises significant concern that the amount of lead cannot be consistently controlled during the manufacturing process of metal alloys over a long period of time, in part because the lead that is present is likely due primarily to the metallic nature of earth materials. There are quite a lot of different metallic materials (including but not limited to copper alloy, tin alloy, zinc alloy and nickel) where such variability exists and where technological controls are not feasible nor practicable given the metallic nature of the substances.

**Conclusions:**

- Certain metal components cannot consistently meet the lower 100 ppm lead limit and should be excluded from the requirement when it is enacted in 2011.
- CPSC should carefully study the repeatability of testing for substrates so they do not set a standard that will allow the variation in test results to disrupt supply chains and needlessly cause bans. The reliability of current state of the art testing of materials that contain less than 100 ppm lead is of great concern.
- CPSC should use its discretion to grant exclusions and to make clarify that enforcement will only be focused on non-exempt products manufactured as of August 14, 2011.

Thank you for the opportunity to comment. We reserve the right to file supplemental comments based upon additional information and data as it becomes available.

Sincerely,

A handwritten signature in black ink, appearing to read "Ed Desmond". The signature is fluid and cursive, with the first name "Ed" being particularly prominent.

Ed Desmond,

### **Comments of Consumer Federation of America to the U.S. Consumer Product Safety Commission**

**on**

### **“Children’s Products Containing Lead; Technological Feasibility of 100 ppm for Lead Content; Request for Comments and Information”**

#### **Introduction**

Consumer Federation of America (CFA) submits the following comments in response to the U.S. Consumer Product Safety Commission (“CPSC” or “Commission”) in the above-referenced matter (“Request for Comments”).<sup>1</sup> The CPSC has issued this Notice of Requirements pursuant to section 101(a) of the Consumer Product Safety Improvement Act (CPSIA) (15 U.S.C 1278a(a), Public Law 110-314). In this Request for Comments, CPSC requests information on the technological feasibility for manufacturers to meet the 100 ppm lead content limit for specific children’s products or product categories. We submit these comments in response to the CPSC’s Request for Comments.

---

<sup>1</sup> “Children’s Products Containing Lead; Technological Feasibility of 100 ppm for Lead Content; Request for Comments and Information” 75 Fed. Reg., Vol. 75, No. 143, July 27, 2010.

## Background

Section 101(a) of the CPSIA provides that for products designed or intended primarily for children 12 years old and younger, the total lead content limit by weight in any part of a children's product is limited to 300 ppm as of August 14, 2009; and 100 ppm as of August 14, 2011, unless the Commission determines that it is not technologically feasible to have this lower limit for a product or product category. The Commission may make this determination after notice and comment and after analyzing the public health protections associated with substantially reducing lead in children's products. If the Commission determines that the 100 ppm lead content limit is not technologically feasible for a product or product category, the Commission shall, by regulation, establish the lowest amount below 300 ppm that it determines is technologically feasible.<sup>2</sup>

As the Commission analyzes the public health protections associated with substantially reducing lead in children's products and determines technological feasibility, we urge the Commission to consider the following information.

In December of 2008, a Task Group on Lead Levels<sup>3</sup> submitted a Memorandum to John Blair, then Chairman of ASTM F.15.62. The Memorandum focused on the Specification for Lead Content in Polyvinyl Chloride (PVC) Plastics Used in Children's Consumer Products, but included a section on the broader impacts of low levels of lead, which are directly relevant to the issue raised in this Request for Comments. The paragraphs that follow are from this document.<sup>4</sup>

---

<sup>2</sup> Children's Products Containing Lead; Technological Feasibility of 100 ppm for Lead Content; Request for Comments and Information" 75 Fed. Reg., Vol. 75, No. 143, July 27, 2010, at 43942.

<sup>3</sup> The Task Group on Lead Levels, ASTM F.15.62, included: Rachel Weintraub Director of Product Safety and Senior Counsel, Consumer Federation of America; Cindy Pellegrini, Assistant Director, Dept. of Federal Affairs, American Academy of Pediatrics; Marissa Scalia Sucusky, MPH, Epidemiologist, Lead Poisoning Prevention Branch Centers for Disease Control and Prevention; Don Mays, Senior Director, Product Safety and Technical Public Policy, Consumers Union; Darlene Watford, Environmental Scientist US EPA/OPPTS Program Assessment and Outreach Branch U.S. Environmental Protection Agency; and David E. Jacobs, PhD, CIH, Director of Research, National Center for Healthy Housing.

<sup>4</sup> Full Memorandum is available upon request from Rachel Weintraub at Consumer Federation of America.

The overall weight of available studies provides clear evidence of significant health problems in young children associated with blood lead concentrations in the range of 5 to 10 micrograms per deciliter ( $\mu\text{g}/\text{dL}$ ), and possibly lower. Exposure to lead has been shown to have neurocognitive effects, including decreased IQ levels, and lower academic achievement, even at low levels of exposure. Cognitive effects have been reported by several studies when blood lead levels have been lower than 10  $\mu\text{g}/\text{dL}$ .<sup>5,6,7</sup> Intellectual functioning has been shown to be impaired, even when blood lead levels never exceeded 10  $\mu\text{g}/\text{dL}$ .<sup>8,9</sup> Another study indicated an inverse relationship between blood lead level and mental and psychomotor development, i.e., even though the children's blood lead levels did not exceed 10  $\mu\text{g}/\text{dL}$ , development was impaired proportionately to the recorded blood lead level.<sup>10</sup> Finally, another study reported intellectual deficits in children whose blood lead levels never exceeded 7.5  $\mu\text{g}/\text{dL}$ .<sup>11</sup> A decline of 6.2 points in full scale IQ for an increase in concurrent blood lead levels from 1 to 10  $\mu\text{g}/\text{dL}$  has been shown in this study, a pooled analysis of results derived from seven well-conducted prospective epidemiologic studies.

Thus, lead levels even at relatively low levels have been linked to developmental delays and other neurocognitive decrements. It is for this reason that the CDC has

<sup>11</sup> Lanphear BP, Hornung R, Khoury J, et al. Low-level environmental lead exposure and children's intellectual function: an international pooled analysis. *Environ Health Perspect* 2005; 113:894-99.

determined that there is no “safe” threshold below which adverse health effects have not been identified and that a blood level of 10 µg/dL or greater is not a threshold for the harmful effects of lead.

In CPSC’s document, “What You Should Know About Lead Based Paint in Your Home: Safety Alert,” CPSC Document #5054,<sup>12</sup> CPSC states:

In children, lead poisoning can cause irreversible brain damage and can impair mental functioning. It can retard mental and physical development and reduce attention span. It can also retard fetal development even at extremely low levels of lead. In adults, it can cause irritability, poor muscle coordination, and nerve damage to the sense organs and nerves controlling the body. Lead poisoning may also cause problems with reproduction (such as a decreased sperm count). It may also increase blood pressure. Thus, young children, fetuses, infants, and adults with high blood pressure are the most vulnerable to the effects of lead.

Scientific evidence unequivocally demonstrates that exposure to low levels of lead causes harm. Therefore, exposure to lead should be as low as possible. Reducing the lead standard for certain children’s products to 100 ppm reflects the public health imperative to reduce lead exposure as much as possible.

In addition to documenting that low levels of exposure of lead levels cause harm, the Memorandum of the Task Group on Lead Levels also included a section on “Testing and Detection”:

Based upon a survey of National Lead Laboratory Accreditation Program (NLLAP) laboratories, it is clear that most laboratories have method detection limits of 10 ppm or lower, using Inductively Coupled Plasma Emission Spectroscopy (ICP). Most, in fact can test to a significantly lower level using ICP or other testing methodologies. Only one laboratory out of the 13 for which

---

<sup>12</sup> Available on the web at <http://www.epsc.gov/epscpub/pubs/5054.html>.

information was received was not able to detect lead at concentrations under 10 ppm.

Thus, since most laboratories can detect lead levels at concentrations below 10 ppm, detecting compliance with a 100 ppm standard would be technologically feasible.

Further, Section 101(f) of the CPSIA reduced the lead limit for paints and surface coatings from 600 ppm to 90 ppm on August 14, 2009. Section 101(f) amends section 1303.1 of CPSC's regulations (16 C.F.R. 1301.1) by substituting "0.009 percent for 0.06 percent" in subsection (a) of that section. We were unable to identify a statement by a paint or surface coating manufacturer expressing difficulty as it sought to comply with this new standard. CPSC should reach out to the paint industry to learn how that industry found it technologically feasible to comply with an even lower lead limit than what section 101(a) could require.

### **Recommendations**

We urge the CPSC to consider the public health protections associated with substantially reducing lead in children's products as it considers lowering the lead limit for children's products to 100 ppm. Accreditation bodies can currently identify lead levels in products at levels far below 100ppm making detection at and below that level technologically feasible. Further, CPSC should research how the paint and surface coating industry found it technologically feasible to comply with the 90 ppm limit in section 101(f) of the CPSIA, and determine the similarities between compliance with section 101(f) and 101(a).

Respectfully submitted,

Rachel Weintraub  
Director of Product Safety and Senior Counsel  
Consumer Federation of America

**Re: Comments on the Technological Feasibility of 100 ppm for Lead Content in Children's Products (Docket No. CPSC-2010-0080)**

Dear Mr. Stevenson:

On behalf of the Fashion Jewelry and Accessories Trade Association (FJATA), we appreciate this opportunity to submit comments in response to the Consumer Product Safety Commission's (CPSC or Commission) *Children's Products Containing Lead; Technological Feasibility of 100 ppm for Lead Content; Request for Comments and Information*.<sup>1</sup> FJATA members include many of the leading suppliers and retailers of fashion jewelry, consisting predominantly of small businesses. FJATA's membership includes in excess of 200 companies that manufacture or distribute fashion jewelry in the United States. Members of FJATA have a strong commitment to consumer safety and support risk-based, sensible national limits on the content of lead in children's jewelry.

Section 101(a)(2)(C) of the Consumer Product Safety Improvement Act (CPSIA)<sup>2</sup> requires the CPSC to reduce the amount of lead in children's products to 100 ppm on August 14, 2011, unless the Commission determines that the limit is not technologically feasible for a product or product category. A wide variety of different materials may be used in jewelry, including: base metals; various metals used in plating, such as copper, nickel, sterling silver, or karat gold; glass and crystal; plastic; wood; solder; filament; textiles; epoxies; enamelwork; paint and surface coatings; and more. The feasibility of meeting a limit on total lead content of 100 ppm is highly dependent on the particular materials involved.

---

<sup>1</sup> See *Children's Products Containing Lead; Technological Feasibility of 100 ppm for Lead Content; Request for Comments and Information*, 75 Fed. Reg. 43,942 (July 27, 2010) (Docket No. CPSC-2010-0080), available at [www.cpsc.gov/businfo/frnotices/fr10/leadTech.pdf](http://www.cpsc.gov/businfo/frnotices/fr10/leadTech.pdf).

<sup>2</sup> Pub. L. No. 110-314, 122 Stat. 3,016 (Aug. 14, 2008) (codified at 15 U.S.C. § 2051 *et seq.*).

FJATA members and suppliers of components and materials used in jewelry have been diligently working to eliminate lead, to the extent technologically feasible, from children's jewelry. The industry, however, is reaching the limits of technological feasibility. Certain materials used in jewelry cannot be manufactured to reliably and consistently achieve a total lead content below 300 ppm. For example, the fundamental nature of the metal alloying and plating process used for fashion jewelry, which involves combining ores or metals that may each have naturally occurring trace amounts of lead, will likely always result in a situation where it will be technologically infeasible to meet a 100 ppm limit on total lead.

Test results furnished by FJATA members show significant variability in total lead content of an identical metal product, not only illustrating the technological infeasibility of meeting a 100 ppm limit in metals and metal-based materials, but also the potential for considerable inter-laboratory variability in test results. These data suggest that the Commission must conclude that reducing the lead limits to 100 ppm is not technically achievable throughout the fashion jewelry industry, and should also adopt an uncertainty factor to allow for normal variability in test results. An uncertainty factor will be particularly vital to avoid unfair enforcement action for products that are safe.

## **I. Background**

Fashion jewelry is an everyday fashion item. Products include bracelets, charms, cuffs, earrings, hair pieces, necklaces, pins, rings, and other fashion accessories principally intended to be worn as an item of personal ornamentation.<sup>3</sup> Styles are many and varied, and change multiple times a year, in keeping with fashion trends. Fashion jewelry often features a combination of materials in a single product. Most often, fashion jewelry is made from a base metal that is plated with copper, nickel or another metal, and a finish coat of silver or gold. Fashion jewelry can also employ glass, crystal, ceramic, plastic, and other natural and synthetic components (wooden beads, seeds, textiles, etc.). Epoxies and enamelwork, and paints or surface coatings may also be used.

Section 101 of the CPSIA currently requires that products intended primarily for children 12 years old and younger contain total lead in quantities of less than 300 ppm. This limit will be reduced to 100 ppm "unless the Commission determines that a limit of 100 [ppm] is not technologically feasible for a product or product category."<sup>4</sup> If the Commission should

---

<sup>3</sup> "Toy jewelry," "novelty jewelry" or similar products where the play value of the item dominates are toys, not jewelry. Jewelry is principally an item of personal ornamentation. These comments exclusively address fashion jewelry.

<sup>4</sup> CPSIA § 101(a)(2)(C).

Mr. Todd A. Stevenson  
September 27, 2010  
Page 3

determine that the 100 ppm lead concentration limit is not technologically feasible, “the Commission shall . . . establish an amount that is the lowest amount of lead, lower than 300 ppm, the Commission determines to be technologically feasible . . . .”<sup>5</sup> The CPSIA and Consumer Product Safety Act (CPSA)<sup>6</sup> further requires that any vendor or manufacturer that distributes in commerce “any children’s product that is subject to a children’s product safety rule” obtain results from an independent third party tester to ensure the product conforms with the lead limitation.<sup>7</sup>

To guide the CPSC in determining whether a lead limit of 100 ppm is technologically feasible for a product or product category, Congress requested the Commission consider whether “technology to comply with the limit is commercially available to manufacturers” and, if “industrial strategies or devices have been developed that are capable or will be capable of achieving such a limit by [August 14, 2011].”<sup>8</sup>

## **II. Technological Feasibility of Achieving 100 PPM Total Lead in Fashion Jewelry**

Some materials that may be used in jewelry, like wooden beads, sterling silver, karat gold, and others are recognized as “low lead” materials that contain less than 100 ppm lead, and are thus exempt from testing for total lead content. FJATA members report that, based on independent third party tests, some materials used as components in children’s jewelry, such as plastic beads, are currently meeting a 200 ppm limit established under a California Proposition 65 settlement agreement, subsequently enacted as law in California and also in Minnesota.<sup>9</sup>

While FJATA continues to believe that on a safety basis crystal should be exempt from the total lead limits, a notable development this year has been the introduction of CPSIA-compliant crystal by a major international crystal manufacturer. These crystals promise similar quality, sparkle and shine of leaded crystals while meeting the 100 ppm limit. Further, commercial deployment of these crystals for use in children’s jewelry and accessories is expected to expand over the coming year.

Mr. Todd A. Stevenson  
 September 27, 2010  
 Page 4

However, metals, including solder metals, will not reliably meet the 100 ppm limit. For example, it is not possible to reliably achieve 100 ppm lead in casting alloys, soft solders, alloys used for chains and wires, and certain other materials, like hard enamel (melted glass) and ceramics, used in jewelry. The technological reason is simple: lead is contained at low trace amounts in raw metals, like tin or zinc, that come from the earth. The alloying process to develop a casting metal, which involves combining different ores that may have trace amounts of lead, can result in adding lead to the finished metal alloy. Further, a finished cast metal jewelry component or product undergoes plating, usually a multi-stage process which adds very thin layers of other metals (*e.g.*, copper, silver, gold). The electroplating process, using other metals which also contain trace amounts of lead, potentially results in the addition of more lead into the finished part. Total lead in an electroplated metal jewelry component, which, per CPSIA, is treated as a single component for testing and compliance purposes, often exceeds 100 ppm as a result.

Many of FJATA’s members report that achieving a total lead content limit of 100 ppm or below in metal components of children’s jewelry is therefore technologically infeasible, since it is impossible to eliminate the trace amounts of lead in the various metals combined to make a jewelry component. Test results illustrate this point. One FJATA member sent identical samples of a soldering alloy to eight independent testing facilities between December 2009 and July 2010 for testing of total lead (digestion method using ICP). These eight labs found lead to be present in the soldering alloy in widely divergent quantities, ranging between less than 50 ppm to 262 ppm, with each lab obtaining a different result. The chart below shows the lead quantity identified in the soldering alloy at each testing facility and the date on which the test was performed:

| Facility  | 1        | 2      | 3      | 4      | 5       | 6       | 7                 | 8       |
|-----------|----------|--------|--------|--------|---------|---------|-------------------|---------|
| PPM       | <50      | 50     | 170    | 191    | 200     | 212     | 217<br>(in-house) | 262     |
| Test Date | 12/15/09 | 7/9/10 | 7/9/10 | 7/9/10 | 12/8/09 | 7/21/10 | 7/1/10            | 7/15/10 |

In each case, however, total lead content met the existing 300 ppm limit.

The test variability this and other members report is consistent with results reported by other industries. For example, a zipper manufacturer reportedly sent samples of zippers to 20 accredited labs and obtained results ranging from 0 to 331 ppm total lead.<sup>10</sup>

<sup>10</sup> *Is it Feasible to Test the Feasible*, Oberle, Sean, Product Safety Letter, August 11, 2010.

One member who makes casting alloys advises that the “low lead” tin the company uses as a starting material for alloying purposes contains 40 ppm as received. The tin is then alloyed with antimony, bismuth, copper or other metals, each of which may also contain trace amounts of lead, to make a casting alloy for the production of fashion jewelry. This member reports that test results on the finished casting alloy suggest total lead content ranging from 90 to 120 ppm. Small differences in naturally-occurring lead in the other ores used in the alloying process cumulatively result in an alloy that can itself contain total lead in excess of 100 ppm, and the exact amount may vary depending on actual trace amounts in the various ores as received. The alloy is used to cast metal jewelry components which in turn are plated, typically in a multi-stage process using copper, nickel, silver and/or gold. In each step of the process, additional trace quantities of lead in the plating material might be added, thus resulting in a component that again could exceed 100 ppm.

In short, metals and metal solder widely used in fashion jewelry do not reliably, accurately, and consistently meet 100 ppm. Moreover, because naturally occurring levels of lead are present in metals, it will likely never be possible to establish the technological feasibility of meeting a 100 ppm limit in metal components, including solder.

### **III. Other Factors Influencing Compliance: Test Variability**

The data discussed above is typical of the variability FJATA members report seeing in lead tests. Even where tests have been conducted on the same lot of products, as illustrated above, different in-house and accredited third-party laboratories each obtained different results. Test data on metal solder summarized above indicates that 25% of the CPSC accredited testing facilities in this sample would have confirmed that the soldering alloy met the 100 ppm limit, but 75% of the laboratories confirmed that the alloy did not meet this limit. All eight facilities showed compliance with a 300 ppm limit, but with a variability of over 200 ppm. Inter-laboratory variability in other instances yields an even larger disparity, with some results exceeding 300 ppm and variability in excess of 300 ppm.

The variability seen in test results suggests the need for the Commission to adopt statistical uncertainty bands to address inter-laboratory variability. That need is all the more critical because of the Commission’s proposed test rule, which imposes on manufacturers the obligation to identify and address “failures” to meet applicable rules, bans, standards and regulations enforced by the Commission. Without addressing statistical uncertainty, a single test yielding a level in excess of applicable limits is a failure.

### **IV. Conclusion**

It is not technologically feasible to reduce total lead content below 300 ppm in jewelry. Even “low lead” metals widely used in the fashion jewelry industry, when alloyed into an appropriate casting alloy and electroplated, will not reliably meet a 100 ppm total content limit

KELLER AND HECKMAN LLP

Mr. Todd A. Stevenson  
September 27, 2010  
Page 6

because naturally-occurring amounts of lead may be combined in the alloying and plating process to result in total content in the 300 ppm range. Further, the Commission should establish statistical uncertainty bands to account for inter-laboratory variability.

FJATA appreciates the opportunity to submit these comments.

Sincerely,

Sheila A. Millar

**Comments of Kids In Danger to the U.S. Consumer Product Safety Commission  
on "Children's Products Containing Lead; Technological Feasibility of 100 ppm for Lead Content"**

**Docket No. CPSC-2010-0080**

**Introduction**

Section 101(a) of the Consumer Product Safety Improvement Act ("CPSIA") provides that, as of August 11, 2011, children's products may not contain more than 100 parts per million ("ppm") of lead, unless the Consumer Product Safety Commission ("CPSC" or "Commission"), determines that it is not technologically feasible, after notice and a hearing and after analyzing the public health protections associated with substantially reducing lead in children's products.<sup>1</sup>

Through publication of a notice in the *Federal Register*, the Commission has invited comments concerning the issues above, especially on the technological feasibility of meeting the 100 ppm lead content limit for children's products.<sup>2</sup>

**Feasibility of 100ppm requirement for children's products**

This narrow request for comments *only* on technological feasibility will greatly restrict the information CPSC obtains through this Federal Register Notice. The law also calls for CPSC to "analyz(e) the public health

<sup>1</sup> See CPSIA Section 101(a).

<sup>2</sup> "Notice, Docket No. CPSC 2010-0080, **Children's Products Containing Lead; Technological Feasibility of 100 ppm for Lead Content; Request for Comments and Information,**" (July 27, 2010).

protections associated with substantially reducing lead in children's products." The data is clear – any level of lead can be a risk in children's products and every attempt should be made to provide lead-free products (or at least under 100ppm) for children.

Because Kids In Danger is not a testing or scientific organization, CPSC will have to rely on others for the technical information they are seeking. However, here is one additional issue for consideration.

Illinois has had a lead-labeling law in place for a few years. It requires labeling of any child care article, painted toy, or children's jewelry which contains lead over 40ppm, but presumably under the national legal limit of 300ppm for lead content or 90ppm for paint or surface coatings. Since this passed in 2008, there have been very few if any products carrying the labeling – indicating that most products in these categories do not contain lead over 40ppm. CPSC should contact the Illinois Attorney General's office for more information about their experience with this law.

#### **Conclusion**

The methods CPSC has laid out for testing lead content for 300ppm limit can be adapted to testing for 100ppm limit. As with the rest of the CPSIA, CPSC has the tools to carve out any limited exceptions to a 100ppm limit for all items intended for use by children or used in the care of children. Parents assume that the products they buy for their children are lead-free and the 100ppm limit brings CPSC closer to that goal.

Respectfully submitted,

Nancy A. Cowles

**Comments of Consumers Union to the U.S. Consumer Product Safety Commission  
on  
“Children's Products Containing Lead; Technological Feasibility of 100 ppm for Lead  
Content; Request for Comments and Information”  
Docket No. CPSC-2010-0080**

**Introduction**

Consumers Union (CU),<sup>1</sup> the non-profit publisher of *Consumer Reports*®, submits the following comments to the U.S. Consumer Product Safety Commission (“CPSC” or “Commission”) in the above-referenced matter.<sup>2</sup>

---

<sup>1</sup> Consumers Union of United States, Inc., publisher of *Consumer Reports*®, is a nonprofit membership organization chartered in 1936 to provide consumers with information, education, and counsel about goods, services, health and personal finance. Consumers Union’s publications and services have a combined paid circulation of approximately 8.3 million. These publications regularly carry articles on Consumers Union’s own product testing; on health, product safety, and market place economics; and on legislative, judicial, and regulatory actions that affect consumer welfare. Consumers Union’s income is solely derived from the sale of *Consumer Reports*®, its other publications and services, fees, noncommercial contributions and grants. Consumers Union’s publications and services carry no outside advertising and receive no commercial support.

<sup>2</sup> “Children's Products Containing Lead; Technological Feasibility of 100 ppm for Lead Content; Request for Comments and Information,” Federal Register, Vol. 75, No. 143, 43942 (July 27, 2010).

### **Background**

Section 101(a) of the Consumer Product Safety Improvement Act (“CPSIA”) provides that, as of August 11, 2011, children's products may not contain more than 100 parts per million (“ppm”) of lead, unless the Consumer Product Safety Commission determines, after notice and a hearing, and after analyzing the public health protections associated with substantially reducing lead in children's products, that this standard is not technologically feasible for a product or product category. The above-referenced notice requests comment and information on the technological feasibility of meeting the 100 ppm lead content limit for children's products that are not otherwise excluded from the lead limits. In response to the Commission’s request, we submit the following comments.

### **Discussion**

Consumers Union agrees with the American Academy of Pediatrics and other consumer groups that there is no safe level of lead that can be ingested or inhaled by the human body without resulting in potentially harmful health effects.<sup>3</sup> Lead accumulates in the body and is not easily flushed out of the system. There is clear scientific consensus that children are particularly vulnerable to the effects of lead and it is therefore essential to eliminate or at least minimize their exposure to any lead-containing products.

Although lead is a naturally-occurring element, human exposure to lead has been exacerbated by contamination of our environment by previous widespread use of leaded gasoline and lead in paint. These facts make it difficult to reduce lead levels to nil in the manufacture of any consumer product that uses natural resources as raw materials. However, it is entirely possible – and essential for the public health – to reduce lead in consumer products, particularly children’s products, to the lowest levels that are technologically feasible.

Recent tests conducted by CU for a report on heavy metals, published in the October 2010 issue of *Consumer Reports*®, indicate that there are children’s products on the market right now that

---

<sup>3</sup> “Protecting Children from Lead-Tainted Imports,” Testimony of Dana Best on Behalf of the American Academy of Pediatrics before the Energy and Commerce Subcommittee on Commerce, Trade, and Consumer Protection, September 20, 2007 <<http://www.aap.org/advocacy/washing/Testimonies-Statements-Petitions/09-20-07-L.lead-Tainted-Imports-Testimony.pdf>>.

are being manufactured with lead levels under 100 ppm total lead. The report did identify some products in this test that had high levels of lead, but they are just a few of the items we screened or analyzed for total lead and not representative of the class of products as a whole.

The CU tests were conducted using X-Ray Fluorescence (XRF) spectrophotometry as a screening test, followed by emission spectroscopy testing via inductively coupled plasma with mass spectrometry (ICP-MS) samples for which XRF readings indicated may contain higher amounts of four heavy metals. This report examined a variety of household items that seemed likely to contain heavy metals based on past experience, as well as recalls of similar products. Of the 30 different models of household products tested, 11 had either packaging that was geared toward children or featured certain characteristics that CU felt could appeal to those 12 or younger. These products included children's jewelry, vinyl children's products, children's clothing, and cell phone charms.

Of the approximately 11 products tested which were either marketed to children, or which CU felt should be considered children's products, only two products – a vinyl raincoat and a cell phone charm – contained more than 100 ppm of lead in samples analyzed when tested by ICP-MS.<sup>4</sup>

One item that tested high in lead was a children's vinyl raincoat. Samples purchased in 2009 had some parts containing more than 1,000 ppm of lead. But similar parts in newer samples purchased in 2010, after the manufacturer reformulated the raincoat, contained only low or trace amounts of lead (well below 100 ppm). While we are concerned that a raincoat labeled by the manufacturer as "100% lead free" when it still contained low or trace amounts of lead could mislead consumers and so should not be labeled as such, the example of the raincoat purchased in 2010 suggests that some children's products are already being manufactured with less than 100 ppm total lead. Thus, it stands to reason that if this children's vinyl product can be manufactured with only trace amounts of lead, other children's vinyl products could also meet a 100 ppm maximum limit.

---

<sup>4</sup> Although cell phone charms are not generally marketed specifically to children 12 and under, they could appeal to that age group when they are sold in stores that cater to pre-teenagers as well as teenagers.

For some other children's products tested, children's earrings ranged from 12 to 18 ppm, metal hair barrettes ranged from 35 to 95 ppm, beaded necklaces ranged from 14 to 60 ppm, and one style of cell phone charm tested at 24 to 27 ppm lead.

This data, although limited, suggests that some children's products may already comply with the 100 ppm lead standard. However, we believe it is important for manufacturers to be more vigilant in their quality control practices to ensure that all batches they produce consistently meet a 100 ppm lead limit. That may require, for example, preventing the use of reground vinyl and reconstituted reclaimed metal when manufacturing children's products. Testing and regular quality checks on raw materials used in manufacturing may be an essential process control element to ensure that final production products are in compliance with tighter lead limits.

#### **Recommendations**

We commend CPSC's efforts thus far to reduce lead content in children's products. Going forward, it is our opinion that because a number of children's products may already contain no more than 100 ppm total lead, this standard could be met by all manufacturers of such products. We encourage the Commission to adopt the new lead limits to become effective on August 11, 2011.

Re: Request for Comments and Information on  
Technological Feasibility of 100 ppm for Lead  
Content, 75 Fed. Reg. 43942 (July 27, 2010),  
CPSC Docket 2010-0080

Dear Mr. Stevenson:

I am writing on behalf of the Bicycle Product Suppliers Association, (“BPSA”) which is an association of suppliers of bicycles, parts, accessories and services who serve the specialty bicycle retailer.

On July 27, 2010, the U.S. Consumer Product Safety Commission (CPSC) published a request for comment and information on the technological feasibility of a 100 ppm standard for lead content for specific children’s products or product categories. 75 Fed. Reg. 43942. Section 101(a) of the Consumer Product Safety Improvement Act (CPSIA) provides that the total lead content by weight in any accessible part of a children’s product is limited to 300 ppm as of August 14, 2009, and 100 ppm as of August 14, 2011, unless the Commission determines that it is not technologically feasible to have this lower limit for a product or product category. The law provides guidance to the Commission on how to interpret “technological feasibility” with respect to a particular product or product category.

The purpose of these comments is to provide information demonstrating that a 100 ppm limit for lead content in metal alloys used in children’s bicycles is neither technologically feasible nor economically practicable.

The first statutory criterion for determining “technological feasibility” is whether a product that complies with the limit is commercially available in the product category. To the knowledge of BPSA members, there is no children’s bicycle commercially available that currently complies with a 100 ppm limit in all accessible components. BPSA members who manufacture children’s bicycles and bicycle products have been striving to comply with the 100

Mr. Todd Stevenson  
September 27, 2010  
Page 2

ppm standard because retailers are requesting early compliance in advance of the August 2011 effective date, but these manufacturers have been unable to assure consistent compliance in the bicycle components that are manufactured from metal alloys. (BPSA notes that, consistent with the information provided in its exemption petition filed in 2009, it does not need or seek relief with respect to non-metallic bicycle components. For example, hand grips on children's bicycles – which are the component most likely to be touched on a consistent basis during bicycle operation – are capable of meeting a 100 ppm standard and will comply with this standard before August 14, 2011.)

The components that cannot consistently satisfy a 100 ppm standard include the following: tire valve stems (information regarding the need for lead in this component and the infeasibility of compliance with the lead standard for this component has been provided previously to the Commission by BPSA), sprocket, spokes, seat rails, seat post collar, seat post, rear sprocket- cassette/cog, rear hub shell, rear axle, RD mount, RD guard, RD cage, pedal body, hub shell, hub axle, headset top bolt, headset cup, handlebar (but see note above regarding feasibility of compliance by hand grips), frame, fork legs, foot pegs, crank arm, chain, brake pad, and brake arm link.

These metal alloy parts all have exceeded 100 ppm in recent testing by a CPSC certified laboratory. These components are generally made in China in factories that typically are not owned by the manufacturers. Although the bicycle manufacturers are specifying 100 ppm, they are not able to obtain consistent compliance with this specification. The issue appears to be variability in recycled content of the raw materials used by the factories. The only solution that would assure consistent compliance would be the use of "virgin" raw materials, which would likely increase the cost of the finished children's bicycle product substantially. Although BPSA members have not been able to obtain comparative costs for all of the metal alloy components on bicycles, one component for which comparative data is available is the inner tube valve stem, which would increase in price by as much as 28% in some sizes, and would increase on average by 12% if manufactured of virgin (or otherwise guaranteed "low lead") raw material. Moreover, as there is not an unlimited supply of virgin raw material, increasing demand for the use of virgin raw materials for children's bicycles (and, presumably, other children's products), will cause the price to become even more expensive over time.

The second statutory criterion is whether "technology to comply with the limit is commercially available to manufacturers or is otherwise available within the common meaning of the term." BPSA submits that the use of virgin raw materials should not be considered to be "commercially available" for purposes of manufacturing children's bicycles that currently cost less than \$100. While virgin raw materials are theoretically available in the market to children's bicycle manufacturers, they are not available at any price that is consistent with the market for children's bicycles. A requirement to certify to 100 ppm for metal alloy components on children's bicycles is, at least right now, a de facto requirement to rely on virgin raw materials to manufacture those components, which would effectively increase the average price of children's bicycles substantially, by a range of 12-28% if the example above turns out to be typical of other metal alloy components on the bicycles.

Mr. Todd Stevenson  
September 27, 2010  
Page 3

The third and fourth statutory criteria are that “industrial strategies or devices have been developed that are capable or will be capable of achieving such a limit by the effective date of the limit and that companies, acting in good faith, are generally capable of adopting; or alternative practices, best practices, or other operational changes would allow the manufacturer to comply with the limit.” BPSA members are not aware of any “industrial strategies or devices” that would ensure consistent compliance with the 100 ppm limit, except to convert to sourcing these components from virgin raw materials, which is not practicable for products at this price point.

BPSA has previously provided scientific evidence to the CPSC regarding the extremely low health risk from exposure to lead in children’s bicycles in connection with its 2009 petition for an exemption from the lead standard, and respectfully incorporates that scientific information by reference in these comments. In light of this extremely low health risk, and the devastating effect on the availability of moderately priced children’s bicycles from imposing a 100 ppm lead content limit, BPSA respectfully urges the CPSC to find that a 100 ppm lead content limit is not technologically feasible for metal alloy components on children’s bicycles at this time, and retain instead the 300 ppm limit for these components.

BPSA members are still in the process of obtaining additional supporting information and expect to supplement these comments in the near future.

We appreciate your consideration of these comments.

Sincerely,

*Erika Z. Jones*

**Re: Docket No. CPSC- 2010-0080**

**Technological Feasibility of 100 ppm for Lead Content in Juvenile Products**

The Juvenile Products Manufacturers Association (“JPMA”) is a national trade organization representing 95% of the prenatal to preschool manufacturing industry. JPMA represents approximately 250 companies in the United States, Canada, and Mexico who manufacture, import and/or distribute infant products such as cribs, car seats, strollers, bedding, and a wide range of accessories and decorative items. JPMA has been recognized as an organization dedicated to enhancing children’s product safety. JPMA’s extensive history of leadership in juvenile product safety includes the development of a comprehensive Certification Program to help guide parents and caregivers toward purchasing juvenile products that are built with safety in mind. JPMA continues to work with government officials, consumer groups, and industry leaders on programs to educate consumers on the safe selection and use of juvenile products. *Safe & Sound for Baby* and Baby Safety Month are only a few of the programs JPMA sponsors to keep today’s safety conscious parents informed.

The comments and information in this letter are provided in response to the above Docket, requesting comments on the feasibility of reduction of the lead limit for manufactured children’s products from the current 300ppm limit to 100ppm, effective for goods manufactured as of August 14, 2011. We reserve the right to file supplemental comments based upon additional information and data as it becomes available.

Section 101(a) of the CPSIA (15 U.S.C. 1278a(a)) provides that, for products designed or intended primarily for children 12 years old and younger, the total lead content limit by weight in any part of a children’s product is limited to 300 ppm as of August 14, 2009, and 100 ppm of lead as of August 14, 2011, unless the Commission determines that it is not technologically feasible to have this lower limit for a product or product category. The Commission may make such a determination after notice and a hearing and after analyzing the public health protections associated with substantially reducing lead in children’s products. If the Commission determines that the 100 ppm lead content limit is not technologically feasible for a product or product category, the Commission shall, by regulation, establish the lowest amount below 300 ppm that it determines is technologically feasible.

The Commission by regulations at 16 CFR 1500.87 through 1500.91, has defined which children's products, including the components parts of children's products, are or are not subject to the lead limits, testing and certification requirements of section 14(a)(2) of the Consumer Product Safety Act ("CPSA"). (15 U.S.C. 2063(a)(2)). Also CPSC has already recognized that certain electronic products per congressional exclusion are outside the scope of such requirements ( See 16 CFR §1500.88 Exemptions from lead limits under section 101 of the Consumer Product Safety Improvement Act for Certain Electronic Devices, February 12, 2009).

The Commission has now requested comment and information concerning the technological feasibility of meeting the 100 ppm lead content limit for children's products that are not otherwise excluded from the lead limits under its current exclusionary rule. Section 101(d) of the CPSIA (15 U.S.C 1278a(d)) provides that a lead limit shall be deemed technologically feasible with regard to a product or product category if:

- (1) a product that complies with the limit is commercially available in the product category;*
- (2) technology to comply with the limit is commercially available to manufacturers or is otherwise available within the common meaning of the term;*
- (3) industrial strategies or devices have been developed that are capable or will be capable of achieving such a limit by the effective date of the limit and that companies, acting in good faith, are generally capable of adopting; or*
- (4) alternative practices, best practices, or other operational changes would allow the manufacturer to comply with the limit.*

The Commission has requested information on the feasibility for manufacturers to meet the future 100 ppm lead content limit for specific children's products or product categories. The CPSC has requested that comments address products or materials that currently comply with 300 ppm lead content limit which are required to meet the 100 ppm lead content limit effective August 14, 2011.

### **Laboratory Tests Exhibit Variation**

When metals such as lead that are contained in other metals such as steel are tested there can be issues with the extractability of the suspect metal as well as errors in measuring the amounts of lead. Members reported experience indicates that reliability of current state of the art testing of materials, particularly metallic alloys, which contain less than 100 ppm lead is questionable. Given that materials that meet the requirement on one test could fail another, a manufacturer could test at the beginning of their first production run and ship products to the market only to have a subsequent test fail that could require recall of the first production batch due to testing variations.

Test methods are critical when testing for lead at 100 ppm. Slight variations from one lab to another will likely result in products passing one test and failing another. Metallurgists and chemists indicate that errors can occur when several metals are in the same sample, (i.e. steel and lead) due to the readings from the primary metal interfering with the results of other metals that are present in smaller amounts.

Alloys can have a considerable range of extractability so extraction methods are also critical. Any variation in the method can influence the results given the small amounts of lead that are in the samples. It may be too early to know all of the ramifications of these issues which makes it all the more important for the CPSC to carefully explore the magnitude of potential problems before implementing a standard that can cause serious disruptions in the marketplace.

### **Plastic Materials in Juvenile Products**

JPMA's experience has suggested that most non metallic materials can generally be manufactured to meet the 100 ppm lead requirements and that compliance with a 100 ppm limit is technologically feasible, provided that virgin plastics are used in the manufacture of juvenile products (without recycled plastic) and that pigments or colorants used to the color such plastics are not otherwise contaminated by impurities containing lead. However, there continues to exist a concern in the marketplace about variations in testing methodology and procedures globally that likely result in some variations in test results. With increasingly lower limits being imposed to trace levels, it is essential that such variability be reduced or eliminated or recognized as a matter of enforcement policy. Based upon reported complaints, it is essential that the potential for environmental contamination of tested samples or variability in test results from test methods employed be recognized and that a sufficient margin of error be recognized as a matter of enforcement policy. With reported variations ranging from 10 to as much as 60ppm the margin for error is slim. In order to address these concerns, JPMA suggest that a margin for error in testing be incorporated into CPSC Enforcement Policy and Test Manuals, so as to assure that variability in testing does not result in de-facto bans of safe product when testing to 100ppm total lead limits.

### **Certain Metal Components**

The Association has submitted production representative samples that contained a variety of metal components including rolled steel, corrosion resistant brass fittings, fasteners, axles, screws, nuts, shafts, bushings, gears, rivets, springs, rods, shafts, antennas, lock pins, and battery contact plates for independent laboratory testing. None of these metal components are accessible so as to be defined as small parts or otherwise present an unreasonable at risk of ingestion by a child<sup>1</sup>. Certain electronic components and other

---

<sup>1</sup> Section 101(b)(2) of CPISA specifies that a component part is not accessible if it is not physically exposed by reason of a sealed covering or casing and does not become physically exposed through reasonably foreseeable use and abuse of the product. Similarly most Juvenile nursery products intended for children under 3 years of age cannot contain small parts per 16 CFR 1501, et seq.

metal components that could not reasonably be accessible without intentional disassembly or destruction of products were not tested. Similarly, JPMA considers products subject to the primary jurisdiction of NHTSA under the National Motor Vehicle Safety Act FMVSS regulations as not comprising consumer products within the meaning of the Consumer Product Safety Act.

We also reviewed representative individual metal components. These parts were assumed to be accessible to touch, but not likely to be handled frequently or ingested. In general, the industry relies upon industrial grade metal structural components, latches, fasteners or automotive grade safety latches of this type that are produced by other industries or consumer grade fasteners, buttons or zippers also fabricated by other industries

While many such hardware components tested below 100 ppm, certain component materials sample such as wheel bushings, bearings, screws, corrosion resistant latches, metal buckles and structural steel had reported lead concentrations in excess of 100 ppm based on ICP-MS testing methodology or based on XRF testing. Some such components when used on electronic nursery products are excluded from the lead limits under the noted exemption, while the very same component parts in non-electronic juvenile products are not. In both scenarios no human health hazard exists, since such parts are not likely to be frequently touched or ingested at all.

All such component items were also subject to lead wipe (conforms to ASTM Standard E 1792 Specification for Wipe Sampling Materials for Lead in Surface Dust). These assessments were consistent with the CPSC's assessment of mouthing behaviors and likely exposure routes. Although it is plausible under normal and reasonably foreseeable use and abuse situations that some portion of the component may be touched, for representative components containing lead concentrations higher than 100 ppm, no lead was accessible for potential exposure based on wipe sampling data so as to pose a health risk from incidental handling.

### **Testing of Accessible Metal Components and Fasteners**

The Commission also seeks comment on any other factors that could affect compliance with this requirement. Specifically, CPSC has expressed an interest in products and materials that currently do not meet the 100 ppm lead content limit, but could meet the 300 ppm lead content limit, including but not limited to information and test data showing the lead content of such products or materials. Based upon reported data from members, the probability of an assembled product failing could be considerable if internal but technically accessible latch or buckle hardware is subject to strict liability testing. This is likely since certain metal components comprised of general use fasteners and other metal latching parts that may be used to assure the safety and integrity of latching mechanisms subject to all types of weather conditions cannot practically be produced in a controlled fashion without a globally sanitized supply chain. Lead occurs naturally and can be a contaminant in structural metals used therein. In order to eliminate lead from other metals, refinement is necessary which drives up costs. There are limits to

which given elements can be removed from an alloy, so that even lead free metals can be contaminated due to machining, recycling and recovery. Lead may be used to modify properties of steel to facilitate machining. Steel can contain 0.015 - 0.35% (150 – 3500 ppm) lead. Due to its low melting point, lead may act as a lubricant during machining. While other additives, such as bismuth, can be used instead of lead the process is proprietary which makes it an expensive and less feasible alternative<sup>2</sup>.

We note that zinc used to coat steel to prevent corrosion also may contain lead. With reclamation of zinc from various sources, the probability is high that zinc will contain more than 100 ppm lead. Given the nature of these component parts and the fact that manufacturers of toys and juvenile products cannot reasonably or technically exert control over the production and supply of such metal component parts, an automatic reduction in lead limits for such parts to 100ppm should not be imposed. Overall, we estimate that almost 50 percent of all metals tested could achieve less than 300ppm, but not less than 100ppm. Given the state of the art in metallurgy 100 ppm is not technologically feasible for all metals. Without assurance across multiple production platforms in a variety of industries producing base materials, quite a lot of different metallic materials (including but not limited to copper alloy, tin alloy, zinc alloy and nickel) cannot feasibly or practically be expected to comply with a 100ppm level with a 100 percent degree of assurance, given the metallic nature of the substances.

#### **Conclusions:**

In conclusion we wish to note that the CPSC should proceed cautiously to assure that:

- Many metal components can consistently be made to meet the lower 100 ppm lead limit subject to reasonable cost and assurance of availability; and if not, excluded from the requirement of the lower threshold limit when it is enacted in August, 2011.
- CPSC should carefully study the repeatability of testing for substrates so they do not set a standard that will allow the variation in test results to disrupt supply chains and needlessly cause bans, since reliability of current state of the art testing of materials that contain less than 100 ppm lead is of great concern.
- CPSC should use its discretion to grant exclusions to non-ingestible metallic component that do not present real world health risks to children.

Thank you for the opportunity to comment.

Sincerely,

  
Robert Waller Jr., CAE  
President

## General Comment

Kristina Hatlelid  
Directorate for Health Sciences  
Consumer Product Safety Commission,  
4330 East West Highway  
Bethesda, Maryland 20814

Dear Ms. Hatlelid:

The Center for Environmental Health is pleased to submit the attached consent judgment with Dollar Tree Stores, Inc. as demonstration of the technological feasibility of the 100 parts per million lead standard in the Consumer Product Safety Improvement Act of 2008.

The consent judgment requires Dollar Tree to meet a lead standard of 40 ppm in children's ponchos.

Sincerely,

Caroline Cox  
Center for Environmental Health

1           **1. INTRODUCTION**

2           **1.1**     On December 18, 2008, plaintiff the Center for Environmental Health  
3 (“CEH”), a non-profit corporation acting in the public interest, filed a complaint in Alameda  
4 County Superior Court, entitled *Center for Environmental Health v. Dollar Tree Distribution,*  
5 *Inc., et al.*, Alameda County Superior Court Case Number RG08425739 (the “Action”), for civil  
6 penalties and injunctive relief pursuant to the provisions of California Health & Safety Code  
7 §25249.5 *et seq.* (“Proposition 65”).

8           **1.2**     Defendants Dollar Tree Distribution, Inc., Dollar Tree Stores, Inc., and  
9 Greenbrier International, Inc. (collectively, “Dollar Tree”) are each a “person in the course of  
10 doing business” under Proposition 65 and manufacture, distribute and/or sell clothing designed to  
11 be worn during wet weather, including but not limited to rain coats, rain jackets, ponchos, rain  
12 bonnets, rain hats and rain boots (each a “Product” and collectively “the Products”) in the State of  
13 California. Dollar Tree and CEH are referred to collectively herein as the Parties.

14           **1.3**     On or about September 26, 2008, CEH served Dollar Tree and the  
15 appropriate public enforcement agencies with the requisite 60-day notice that Dollar Tree is in  
16 violation of Proposition 65. CEH’s notice and the Complaint in this Action allege that Dollar  
17 Tree exposes individuals who use or otherwise handle the Products to lead and/or lead  
18 compounds (referred to interchangeably herein as “Lead”), chemicals known to the State of  
19 California to cause cancer, birth defects and other reproductive harm, without first providing clear  
20 and reasonable warning to such persons regarding the carcinogenicity and reproductive toxicity of  
21 Lead. The notice and Complaint allege that Dollar Tree’s conduct violates Health & Safety Code  
22 §25249.6, the warning provision of Proposition 65.

23           **1.4**     For purposes of this Consent Judgment only, the Parties stipulate that this  
24 Court has jurisdiction over the subject matter of the violations alleged in CEH’s Complaint and  
25 personal jurisdiction over Dollar Tree as to the acts alleged in CEH’s Complaint, that venue is  
26 proper in the County of Alameda, and that this Court has jurisdiction to enter this Consent  
27 Judgment as a full and final resolution of all claims which were or could have been raised in the  
28 Complaint based on the facts alleged therein.

1           1.5     The Parties enter into this Consent Judgment pursuant to a settlement of  
2 certain disputed claims between the Parties as alleged in the Complaint. By executing this  
3 Consent Judgment, the Parties do not admit any facts or conclusions of law. It is the Parties'  
4 intent that nothing in this Consent Judgment shall be construed as an admission by the Parties of  
5 any fact, conclusion of law, issue of law or violation of law, nor shall compliance with the  
6 Consent Judgment constitute or be construed as an admission by the Parties of any fact,  
7 conclusion of law, issue of law, or violation of law. Nothing in this Consent Judgment shall  
8 prejudice, waive or impair any right, remedy, argument or defense the Parties may have in this or  
9 any other or future legal proceedings. This Consent Judgment is the product of negotiation and  
10 compromise and is accepted by the parties, for purposes of settling, compromising and resolving  
11 issues disputed in this action, including future compliance by Dollar Tree with Section 2 of this  
12 Consent Judgment, and shall not be used for any other purpose, or in any other matter.

13           **2.     COMPLIANCE - REFORMULATION**

14           **2.1     Lead Reformulation.** After the date of entry of this Consent Judgment  
15 (the "Compliance Date"). Dollar Tree shall not manufacture, distribute, ship, or sell, or cause to  
16 be manufactured, distributed, or sold, any Product that contains Lead in concentrations that  
17 exceed 40 parts per million ("ppm") or is comprised of any material that contains Lead in  
18 concentrations that exceed 40 ppm. Products that were manufactured prior to the Compliance  
19 Date shall not be subject to the provisions of Section 2, or the related provisions herein.

20           **2.2     Certification of level from suppliers.** Dollar Tree shall obtain written  
21 certification with corresponding test results from its suppliers of the Products certifying that  
22 neither the Products nor any materials of which the Products are comprised contain Lead  
23 concentrations exceeding 40 ppm.

24           **2.3     Testing.** In order to help ensure compliance with the requirements of  
25 Section 2.1, Dollar Tree shall conduct testing to confirm that neither the Products nor any  
26 materials of which the Products are comprised contain less than 40 ppm Lead. Testing pursuant  
27 to this section shall be conducted pursuant to the most current version of United States  
28 Environmental Protection Agency Method SW-846 3051 or Method 3050B (the "Test Protocol").

1 The results of all testing performed pursuant to this section shall be retained for a period of three  
2 years from the date of the test and shall be made available to CEH upon request. Dollar Tree  
3 shall test 8 randomly selected Products from each delivered shipment of each of the Products.

4 **2.3.1 Products that exceed 40 ppm pursuant to Dollar Tree Testing.**

5 If the results of the testing required pursuant to section 2.3 shows levels of Lead exceeding 40  
6 ppm for a Product, Dollar Tree shall return all of the Products that were purchased under the  
7 particular purchase order to the supplier with a letter explaining that such Products do not comply  
8 with the supplier's certification. In addition, Dollar Tree shall increase the number of units tested  
9 to 16 randomly selected Products from each delivered shipment of each of the Products from such  
10 supplier for the two shipments purchased immediately following a Product test exceeding 40  
11 ppm. Should the testing of Products purchased from a particular supplier demonstrate Lead levels  
12 exceeding 40 ppm more than once, Dollar Tree shall cease purchasing Products from such  
13 supplier for a period of at least five years.

14 **2.4 Confirmatory testing by CEH.** CEH intends to conduct periodic testing  
15 of the Products. Any such testing will be conducted pursuant to the Test Protocol at an  
16 independent laboratory. In the event that CEH's testing demonstrates Lead levels in excess of 40  
17 ppm for one or more Products, CEH shall inform Dollar Tree of the violation(s), including  
18 information sufficient to permit Dollar Tree to identify the Product(s). Dollar Tree shall, within  
19 10 days following such notice, provide CEH, at the address listed in section 12, with its supplier  
20 certification and testing information demonstrating its compliance with sections 2.2 and 2.3 of  
21 this Consent Judgment. Dollar Tree shall then increase the amount of testing performed on the  
22 Products supplied by the supplier of the Product(s) for which CEH demonstrates a test with Lead  
23 levels exceeding 40 ppm to 16 randomly selected Products from each delivered shipment from  
24 each purchase order of each of the Products from such supplier for the two purchase orders  
25 following a Product test exceeding 40 ppm. Dollar Tree shall also be liable for stipulated  
26 payments in lieu of penalties for Products for which CEH produces tests demonstrating Lead  
27 levels exceeding 40 ppm as set forth below. These payments shall be made to CEH and used for  
28 the purposes described in section 4.1 and to pay for related attorneys' fees and costs. The

1 stipulated payments in lieu of penalties and other remedies provided for herein are in addition to  
2 any other remedies available to enforce the terms of this Consent Judgment.

3           **2.4.1 Stipulated penalty assuming compliance with sections 2.2 and**  
4 **2.3.** Assuming Dollar Tree provides CEH with information demonstrating that it complied with  
5 sections 2.2 and 2.3 for the Products purchased pursuant to the same purchase order as those with  
6 tests showing Lead levels exceeding 40 ppm, the stipulated penalty shall be as follows for each  
7 unit of Product for which CEH produces a test result with Lead levels exceeding 40 ppm:

|                     |         |
|---------------------|---------|
| 8 First Occurrence  | \$500   |
| 9 Second Occurrence | \$1,000 |
| 10 Third Occurrence | \$2,000 |
| 11 Thereafter       | \$5,000 |

12  
13           **2.4.2 Stipulated penalty assuming non-compliance with sections 2.2**  
14 **and 2.3.** Assuming Dollar Tree fails to provide CEH with information demonstrating that it  
15 complied with sections 2.2 and 2.3 for the Products purchased pursuant to the same purchase  
16 order as those with tests showing Lead levels exceeding 40 ppm, the stipulated penalty shall be as  
17 follows for each unit of Product for which CEH produces a test result with Lead levels exceeding  
18 40 ppm:

|                      |          |
|----------------------|----------|
| 19 First Occurrence  | \$2,000  |
| 20 Second Occurrence | \$5,000  |
| 21 Third Occurrence  | \$10,000 |
| 22 Thereafter        | \$20,000 |

23  
24           **2.4.3 Recall of Products testing in excess of 600 ppm Lead.** Should  
25 CEH's testing demonstrate that a Product contains Lead levels in excess of 600 ppm ("Recall  
26 Product"), Dollar Tree shall send a recall letter to all distribution facilities and retail outlets that  
27 may have received the Products that were purchased in the same purchase order as any Recall  
28 Product informing them that they must pull the items from public distribution and send them back

1 to Dollar Tree. Dollar Tree shall destroy all such Products and send certification to CEH that it  
2 has completed this process. Such certification shall indicate how many units of the Products were  
3 returned via the recall.

4 **3. SETTLEMENT PAYMENTS**

5 **3.1** Within five days of entry of this Consent Judgment. Dollar Tree shall pay a  
6 total of \$45,000 as a settlement payment. This total shall be paid in three separate checks  
7 delivered to the offices of the Lexington Law Group, LLP at the address set forth in section 12  
8 below and made payable and allocated as follows. Any failure by Dollar Tree to comply with the  
9 payment terms herein shall be subject to a stipulated late fee in the amount of \$50 for each day  
10 after the delivery date the payment is received. The late fees required under this section shall be  
11 recoverable, together with reasonable attorneys' fees, in an enforcement proceeding brought  
12 pursuant to section 5 of this Consent Judgment.

13 **3.1.1 Penalty:** The sum of \$1,000 in penalties pursuant to Health and  
14 Safety Code §25249.7(b). This payment shall be made by check payable to Center for  
15 Environmental Health. CEH shall apportion the penalties in accordance with Health and Safety  
16 Code §25249.12.

17 **3.1.2 Monetary Payment in Lieu of Penalty:** The sum of \$14,500 shall  
18 be paid to CEH in lieu of any penalty pursuant to Health and Safety Code §25249.7(b). This  
19 payment shall be made by check payable to Center for Environmental Health. CEH shall use  
20 such funds to continue its work protecting people from exposures to toxic chemicals. As part of  
21 this work, CEH intends to conduct periodic testing of the Products as set forth in section 2.4.

22 **3.1.3 Attorneys' Fees and Costs:** The sum of \$29,500 shall be used to  
23 reimburse CEH and its attorneys for their reasonable investigation fees and costs, attorneys' fees,  
24 and any other costs incurred as a result of investigating, bringing this matter to Dollar Tree's  
25 attention, litigating and negotiating a settlement in the public interest. This payment shall be  
26 made by check payable to Lexington Law Group, LLP.

1           4.     **MODIFICATION OF CONSENT JUDGMENT**

2           4.1     This Consent Judgment may be modified by written agreement of CEH and  
3 Dollar Tree, or upon motion of CEH or Dollar Tree as provided by law.

4           5.     **ENFORCEMENT OF CONSENT JUDGMENT**

5           5.1     CEH may, by motion or application for an order to show cause before the  
6 Superior Court of the County of Alameda, enforce the terms and conditions contained in this  
7 Consent Judgment. Should CEH prevail on any motion or application under this section, CEH  
8 shall be entitled to recover its reasonable attorneys' fees and costs associated with such motion or  
9 application.

10          6.     **APPLICATION OF CONSENT JUDGMENT**

11          6.1     This Consent Judgment shall apply to and be binding upon the Parties  
12 hereto, their divisions, subdivisions and subsidiaries, and the successors or assigns of any of  
13 them.

14          7.     **RELEASE**

15          7.1     This Consent Judgment is a full, final and binding resolution between CEH  
16 and Dollar Tree of any violation of Proposition 65 that was or could have been asserted in the  
17 Complaint against Dollar Tree or its parents, subsidiaries, affiliates, directors, officers,  
18 employees, agents, attorneys, downstream distributors, or customers based on failure to warn  
19 about alleged exposure to Lead contained in the Products, with respect to any Products  
20 manufactured, distributed or sold by Dollar Tree on or prior to the date of entry of this Consent  
21 Judgment. This release does not limit or effect the obligations of any party created under this  
22 Consent Judgment.

23          8.     **SEVERABILITY**

24          8.1     In the event that any of the provisions of this Consent Judgment are held by  
25 a court to be unenforceable, the validity of the enforceable provisions shall not be adversely  
26 affected.

**9. SPECIFIC PERFORMANCE**

9.1 The Parties expressly recognize that Dollar Tree's obligations under this Consent Judgment are unique. In the event that Dollar Tree is found to be in breach of this Consent Judgment for failure to comply with the provisions of Section 2 hereof, the parties agree that it would be extremely impracticable to measure the resulting damages and that such breach would cause irreparable damage. Accordingly, CEH, in addition to any other available rights or remedies, may sue in equity for specific performance, and Dollar Tree expressly waives the defense that a remedy in damages will be adequate.

**10. GOVERNING LAW**

10.1 The terms of this Consent Judgment shall be governed by the laws of the State of California.

**11. RETENTION OF JURISDICTION**

11.1 This Court shall retain jurisdiction of this matter to implement and enforce the terms this Consent Judgment.

**12. PROVISION OF NOTICE**

12.1 All notices required pursuant to this Consent Judgment and correspondence shall be sent to the following:

END OF REPORT

September 27, 2010

Todd A. Stevenson  
Director, Office of the Secretary  
Room 502  
U.S. Consumer Product Safety Commission  
4330 East West Highway  
Bethesda, Maryland 20814

Agency: Consumer Product Safety Commission (CPSC)

Re: Docket No. CPSC-2010-0080 Children's Products Containing Lead; Technological Feasibility of 100 ppm for Lead Content

Dear Mr. Stevenson:

I am hereby submitting comments in response to the Solicitation of Comments on Children's Products Containing Lead; Technological Feasibility of 100 ppm for Lead Content (Docket No. CPSC-2010-0080) published in the Federal Register on July 27, 2010 (the "Proposed Rule").

You have requested feedback and additional information on several topics relating to the prospect of a new lower 100 ppm lead-in-substrate standard. I will attempt to respond to your specific queries at the end of this letter. I find that the questions you have articulated are basically irrelevant to our company's situation. Your questions seem to presume that the standard will be implemented. If you take the step of implementing the new standard, you will be inflicting needless and extension damage to our company with absolutely no corresponding benefit to consumers or the general public. This is terrible and irresponsible public policy. The new standard is not based on science but rather phobia and fear of the unknown. Our business will suffer for no purpose. The jobs lost will at your hand.

I want to comment on process. The agency appears to be in a race to complete its CPSIA rulemakings before year end, damn the consequences. According to [www.regulations.gov](http://www.regulations.gov), the CPSC received 73 comment letters on the Proposed Interpretative Rule for "Children's Product" (CPSC-2010-0029 due June 21, 2010). Nevertheless, as has been widely reported, the agency ignored or glossed over the vast majority of those comments (including all of mine) and pronounced the draft rule to be "final" with virtually no changes. This flagrant disregard of public comments turned the CPSC's rulemaking process into a sham if not an outright breach of law. I believe the agency intends to pass through rulemaking this year to avoid the embarrassment of further extending the CPSIA testing stay due to expire on February 10, 2011. The incentive to give short shrift to our comments grows daily.

I have lost faith in the sincerity of the agency's interest in public comments after two years of being completely ignored. To judge by the agency's disregard of my numerous comment letters, I must add little to your deliberations – in which case I do not understand why you ask me to waste hours on letters like this. After all, if you have no interest in my views, why not let me spend my time on other more productive activities? Unfortunately, I have also learned that any silence by stakeholders will be interpreted as "approval" by the powers-that-be. Thus, we are left with no option but to write these letters. With those thoughts in mind, I hereby submit my comments on the 100 ppm lead standard, fully anticipating that I will be ignored yet again.

I am aware that the agency contends that it is "compelled" to implement this new standard without regard to economics. The extremely rigid legislative language governing the implementation of the 100 ppm standard is thus portrayed as insurmountable. Is the agency truly powerless to resist? I might take that

position more seriously if the agency was equally committed to following the law in other aspects of its daily affairs. However, the CPSC exhibits no such self-restraint. CPSC recalls initiated in flagrant disregard for the “substantial product hazard” standard in Section 15 of the CPSA demonstrates that the agency can invent legal flexibility wherever it wants. For instance, the CPSC pressed for a recall of McDonald’s Shrek glasses (signifying that the glasses were a “substantial product hazard”) despite this June 4<sup>th</sup> acknowledgement by the agency’s Director of Public Affairs in a tweet: "Scott\_Wolfson: Note to reporters: the recalled McDonald's glasses are not toxic." Safe glasses do not constitute a “substantial product hazard” by any definition – yet the agency proceeded anyhow.

So when does the law actually matter, precisely? If safe drinking glasses may be labeled a “substantial product hazard”, then I guess anything goes. I find it worrisome to be regulated by a federal agency which does not abide by a disciplined interpretation of law but instead caters to prevailing political whims. If the law means nothing, then the agency should not presume to assert its inability to resist this provision. I think that’s just too convenient to be believable.

My comments on the proposed 100 ppm standard are informed by my view that the agency can do as it pleases. I have not restricted myself by the fiction that economics don’t matter.

#### **The problems with the 100 ppm Lead Standard:**

- a. The new standard will have NO impact on human health. There is simply no evidence of injuries from lead at levels between 100 ppm and 300 ppm in substrate. It is notable that no other federal agency (NIH, CDC, EPA, FDA, etc.) has identified lead-in-substrate as a human health hazard. Without evidence of injuries at these barely measurable lead levels, the new standard cannot be justified economically or otherwise. It is worth noting that if the “cost” of lead-in-substrate levels of 100-300 ppm cannot be measured, the “benefit” of the new standard will be equally elusive. Given the known costs of this initiative, the new standard fails any conceivable cost-benefit analysis.

I published a study of CPSC recall data from 1999-2010 in my blog ([www.learningresourcesinc.blogspot.com](http://www.learningresourcesinc.blogspot.com)) in May 2010, revealing that only one death has been documented in association with lead in children’s products in the last 11 years, and only three (unverified) lead injuries in the same period. This is substantially fewer childhood fatalities and serious injuries than swimming pools and spas cause in an average day according to CPSC statistics. Given the trillions of daily interactions between children and Children’s Products in the course of a year, these meager 11-year lead injury totals are the statistical equivalent of no injuries. Thus, it will be impossible to prove statistically that any reduction in injuries flows from the change in standard. Troubling? Fear of lead-in-substrate is nothing more than a Congressionally-endorsed fear of cooties.

- b. The new standard will substantially raise our product costs. The new standard means we will need to implement much tighter manufacturing tolerances for materials and for our processes. The many extra man-hours needed to implement and maintain these tighter tolerances will be expensive. It is difficult to estimate the cost, but we project a 10-20% increase in cost for finished goods subject to the new standard. Subcontractors who manufacture our goods will charge us for the risk of waste, plus the additional overhead required by the new standard. That is, they will charge us more if they are still willing to remain a vendor of Children’s Products subject to this standard. We are a small business, so many of our factories may feel our short runs are simply not worth the risk. That’s how I would look at it if I were them. Loss of vendors (manufacturing capacity) is yet another cost we would bear under the new standard.

It is worth noting that based on the results of our last two years of testing (thousands of testing line items), we estimate that less than 2% of our testing line items fall between 100 ppm and 300 ppm in lead as of today. The cost of trolling for those few affected components will be excessive and the waste associated with replacing “defective” materials will be a tax on our entire production and fulfillment processes. Not exactly a stimulus program. . . .

- c. Our ability to control lead levels is unknown because test result variances are so wide. We have found that testing multiple samples from the same lot can show variances of up to 67% in lead content. It doesn’t take much variance to produce wild percentage swings at such trace lead levels. As an illustration, I have attached hereto a test report on a SINGLE PIECE OF PLASTIC STRING used to fasten a mesh bag. The string was tested in ten places, resulting in lead levels of 239 -275 ppm. In another case, we found three test results of the same yellow plastic substrate varied from 23 -139 ppm. None of this matters from a safety standpoint but from a regulatory standpoint, it’s a crisis in the making.

These small variances potentially endanger our business. How are we supposed to run our business selling inexpensive children’s products burdened by such an inflexible physical standard? The CPSC needs to recognize that substrates in the real world are not pure, consistent and invariable. The tight tolerances in this new standard will likely have us retesting several items a month at considerable expense and strain. [And G-d knows what standard the CPSC will inflict on us to govern retesting.] Each retest would presumably interfere with our ability to deliver on time and would stress our system and our people. Out-of-pocket costs would be high, perhaps over \$100,000 per annum for our product portfolio of 1500 items; labor and other frictional costs would no doubt add to this total substantially.

- d. It will be impossible to predict which components will fail. As test results tend to vary significantly for components from the same lot, it is difficult to control or predict problems. We have found violative results for many different materials used in our business – there is no pattern. Defects found in certain components might render the entire finished good worthless, potentially greatly increasing our losses. For example, an inexpensive backpack might be found to have a zipper that violates the new standard upon completion of the production run. This could happen even after extensive pre-manufacturing testing because physical goods tend to vary in composition. Perhaps only a tiny percentage of the zippers violate the new standard by a few ppm, but given the cost to repair and rehab the item and the practical inability to identify violative zippers, the entire lot of backpacks might have to be scrapped. There would be an increased incentive to substitute components across entire product lines, not because of any health or safety concern but simply to avoid regulatory compliance risk. Differences in utility would be a secondary consideration to avoidance of CPSC recalls or scrapping finished goods inventory. This situation would not be stable because consumers would not likely accept lower standards for our products just to mollify the CPSC – other seismic market changes could be anticipated.

- e. The legal risks implicit in the new standard are simply intolerable. Let me ask you a question: how would you attempt to manage a major risk to your business caused by less than 2% of your activity? What if you had no idea WHICH 2% it was? What could you do? I think you might reevaluate your business model. Most people don’t roll the dice on their family wealth or their regular income. By imposing a standard for lead-in-substrate that is barely above measurable levels, the agency would be imposing EXACTLY this risk on us.

We believe we would be exposed to a daily risk of assault by consumer groups and other do-gooders bent on our destruction. This combat would be divorced from considerations of safety –

it would be all about regulatory compliance. Our business purpose is not to pay fees to CPSC Bar attorneys, write up Section 15 reports or perform recalls. We do not have the profit margins to finance this kind of wasteful activity and do not have the spare capacity to deal with the regulatory “crisis of the day”. The legal risks of such conflict can quickly get out of control – and insurance is simply not a viable option economically. If we must bear these heightened risks, we will have to revisit our business model.

I hope the agency will not dare the children’s product industry to go belly up just to prove this point.

- f. Companies, acting in good faith, are generally INCAPABLE of adopting the new standard as a practical matter. Everything can be made of low lead materials. Zippers can be made of platinum, alphabet blocks can be made of wood, cotton fibers or rhodium. Use of recycled materials can be discontinued (the anti-green movement). Durable and inexpensive materials used for years without incident can be discarded in favor of “purer” materials. All of these things are possible. But they are not practical and they are not economic. If we are to indulge the fantasy of the money-oblivious CPSIA, then whatever we can imagine is possible and money doesn’t matter. This is regrettably unrealistic – businesses exist in the real world and money DOES matter. Thus, companies operating in good faith can’t adopt the new standard if their business model is scrambled.
- g. Dealers in our goods can be expected to adopt their own standards to create a regulatory “cushion”. Distributors and retailers have been building their own safe harbors to provide CPSIA protection over the last two years. We have many customers with unique and wildly variant compliance requirements despite the crafting of thousands of pages of rules from the CPSC under the CPSIA. Our dealers can always beat the CPSC in a game of “Can you top this?” If the agency implements a 100 ppm standard, we fully expect a new outbreak of “regulatory compliance exuberance” among retailers. What will happen to us under those circumstances? With a CPSC-fed mania, we will incur yet more costs and bear yet more risks. Our markets will shrink.
- h. We believe these rules will so demoralize and de-motivate our staff that we will face high turnover rates among our employees who know all of your rules. Our regulatory compliance team is not on “work release” from jail. Their jobs are not intended as a form of societal punishment. If, however, compliance with the CPSC’s bureaucratic rules becomes too tedious or risky, or the stress of managing a string of crises and a blizzard of conflicting rules becomes overwhelming, our trusted associates will seek less stressful employment elsewhere. They don’t HAVE TO do this for a living. What is the CPSC planning to do to help small businesses who find themselves back at square one after a costly investment of thousands of dollars in specialized training? Is the new CPSC Small Business Ombudsman going to wave a magic wand to make our problems go away? I think we all know the answer – too bad for us.

**Here are the answers to your questions:**

- 1. Materials that are consistently under 100 ppm in lead content. You have previously provided a list of such materials for the 300 ppm standard. This list included some useful concessions, such as wood and cotton fibers, but also included useless and irritating examples like gold and platinum, gemstones and various byproducts of nuclear decay. In our experience, the common substrate materials used in educational products have varying (trace) levels of lead. As noted above, we have seen significant variances in lead content in a single string, and in substrates

taken from the same lot. I have no confidence that any material we use can be proven to ALWAYS contain than 100 ppm lead.

2. Strategies or Devices to comply with the new 100 ppm standard. The only strategy we could employ is pre-manufacturing testing on materials with substantially increased testing frequency. As noted above, natural variances among many materials prevent us from creating any reliable safe harbor and cost increases from such testing activity (and the cost of scrapping otherwise acceptable raw materials) will greatly shrink our product line. As a consequence, we would likely have to sharply reduce our product line or go out of business – all thanks to the CPSC and our Congress!
3. Consequences of use of compliant materials meeting the needs of the product. We have not spent any resources evaluating the market demand for educational products made of platinum. We do not intend to switch over to osmium or ruthenium for their purported lead-free properties (we find toxicity to be a greater concern). We have not spent our time figuring out if gold is a suitable material for pattern blocks or our Reading Rods. There is no answer to this ridiculous question. As I mentioned above, more than 98% of our test line items complies with the new standard. The materials and components that fail do not fit a pattern. Tests are inconsistent, too.
4. For products that meet the 300 ppm standard but not the 100 ppm standard, provide data on compliance. As noted, we find that we are already 98%+ compliant with the new standard. The components that fail do so unpredictably and inconsistently. Even the same material out of the same lot produces varying test results, as do multiple tests of the same piece of string. We cannot run a business based on junk science intolerance of the world that G-d created. The crazy new 100 ppm lead standard is incompatible with variances found in the physical world.

I want to reiterate that the 100 ppm standard is entirely arbitrary and will save no lives and will preserve no IQ points.

5. Can such items be made compliant through use of other materials? Sure, of course they could. They would be unsalable because the products were rendered too expensive either by the engineering cost or the new materials cost. Is creating products that no one will buy an acceptable solution to this dilemma? Whether by economics (too costly to buy) or re-jiggering of business models (discontinued products), children will be purportedly “safer” because they will lose access to needed products. What a wonderful result! Does the CPSC advocate that American schools teach physical science with photos of magnets, paper clips and rocks? Perhaps we should revert to rote-and-repetition math education rather than modern techniques of hands-on learning. No doubt the CPSC would singlehandedly solve our national education crisis. Bring on pointless material substitutions and let the fun begin.
6. Best practices to be used to always comply with the new standard. I recommend dropping most products and only making items that are CERTAIN to be compliant. This in practical terms may be impossible, and as noted above, is completely uneconomic. Another good practice to discard everything that isn’t virgin material. I know that’s not “green” but we have to be really, really safe, right? Another super idea is to substantially increase our testing, but of course, we cannot afford the current level of testing as it is. That seems somehow unrealistic. Other strict controls on manufacturing seem equally out of reach. There are so many variables to manage to achieve the new standards – we must control the factory environment as though it were a hospital ICU. That’s just not possible at current cost levels. Our factories would have to be “restructured”. I bet the Small Business Ombudsman can coach us on this!!!

Please note: we don't have to reorganize our factories because we don't have to stay in the children's product market. If the CPSC expects us to reorganize our entire way of doing business to accommodate a phobic standard not based on any observable public health problem, we may opt out. Is this really the purpose of the CPSC – to micromanage markets, to restructure the economy, to substitute for market forces? I think not. Please check the CPSA to see why your agency exists. I hope a Republican-controlled Congress will do exactly the same thing in a few weeks' time.

7. The lowest technologically feasible lead level below 300 ppm in our products. We can achieve anything for a cost. There are no "lowest" levels. Why not specify entirely lead-free? We can make everything out of gold and osmium! Lay in a few gemstones and diamonds, and you will have a sparkling new toy that cannot poison anyone with lead. It may have other problems (choking hazards? Sharp points?) but at least no one will die from lead poisoning. Not that anyone did previously . . . .
8. The date by which our products can meet the 100 ppm standard. In my opinion, the date is NEVER, because we have no practical ability to control quality to the level you require. Even at our current 98%+ compliance with the new standard, it would be extraordinarily disruptive to attempt to be 100% compliant. After a few episodes of being shut down by the CPSC or sued by some lunatic consumer group over nothing, we would exit the market. If you intend to deprive us of the meaning and pleasure of our work to make children's lives better, we'll leave the well-being and education of our nation's children to you. That would be a very sad day for us.

Thank you for considering my views on this important subject. This letter took me all day; I hope you won't completely ignore it as you have all my other letters.

Sincerely,

Richard Woldenberg

## General Comment

Kristina Hatlelid  
Directorate for Health Sciences  
Consumer Product Safety Commission,  
4330 East West Highway  
Bethesda, Maryland 20814

Dear Ms. Hatlelid:

The Center for Environmental Health is pleased to provide CPSC with the attached test data regarding lead content of children's products. The data consists of over 2,000 measurements made with an x-ray fluorescence analyzer of components of children's products purchased from major retailers between September 2009 and July 2010. All components in the attached file have lead contents below 100 parts per million.

The data demonstrates that most of the materials necessary for the production of children's products can meet the 100 ppm standard established by the Consumer Product Safety Improvement Act of 2008.

Thank you for this opportunity.

Caroline Cox  
Center for Environmental Health
